## 1. General Description

The RM69092 device is a single-chip solution for LTPS AMOLED that incorporates gate drivers and is capable of 480RGBx480, 400RGBx400, 360RGBx480, 320RGBx320, 320RGBx480, 272RGBx480, 240RGBx240, 240RGBx320, 180RGBx360, 180RGBx540, 128RGBx432 with internal GRAM. It includes a 2,764,800 bits internal memory, a timing controller with glass interface level-shifters and a glass power supply circuit.

The RM69092 supports MIPI Interface, 8-bit system interfaces, serial peripheral interfaces (SPI), dual serial peripheral interfaces (Dual-SPI). The specified window area can be updated selectively, so that moving pictures can be displayed simultaneously independent of the still picture area.

The RM69092 is also able to make gamma correction settings separately for RGB dots to allow benign adjustments to panel characteristics, resulting in higher display qualities. The IC possesses internal GRAM that stores 480 x 480 x 1/2 x 24 bits for 16.77M-color images. A deep standby mode is also supported for lower power consumption.

This LSI is suitable for wearable device applications, including I-watch and smart band.

CONFIDENTIAL

## 2. Features

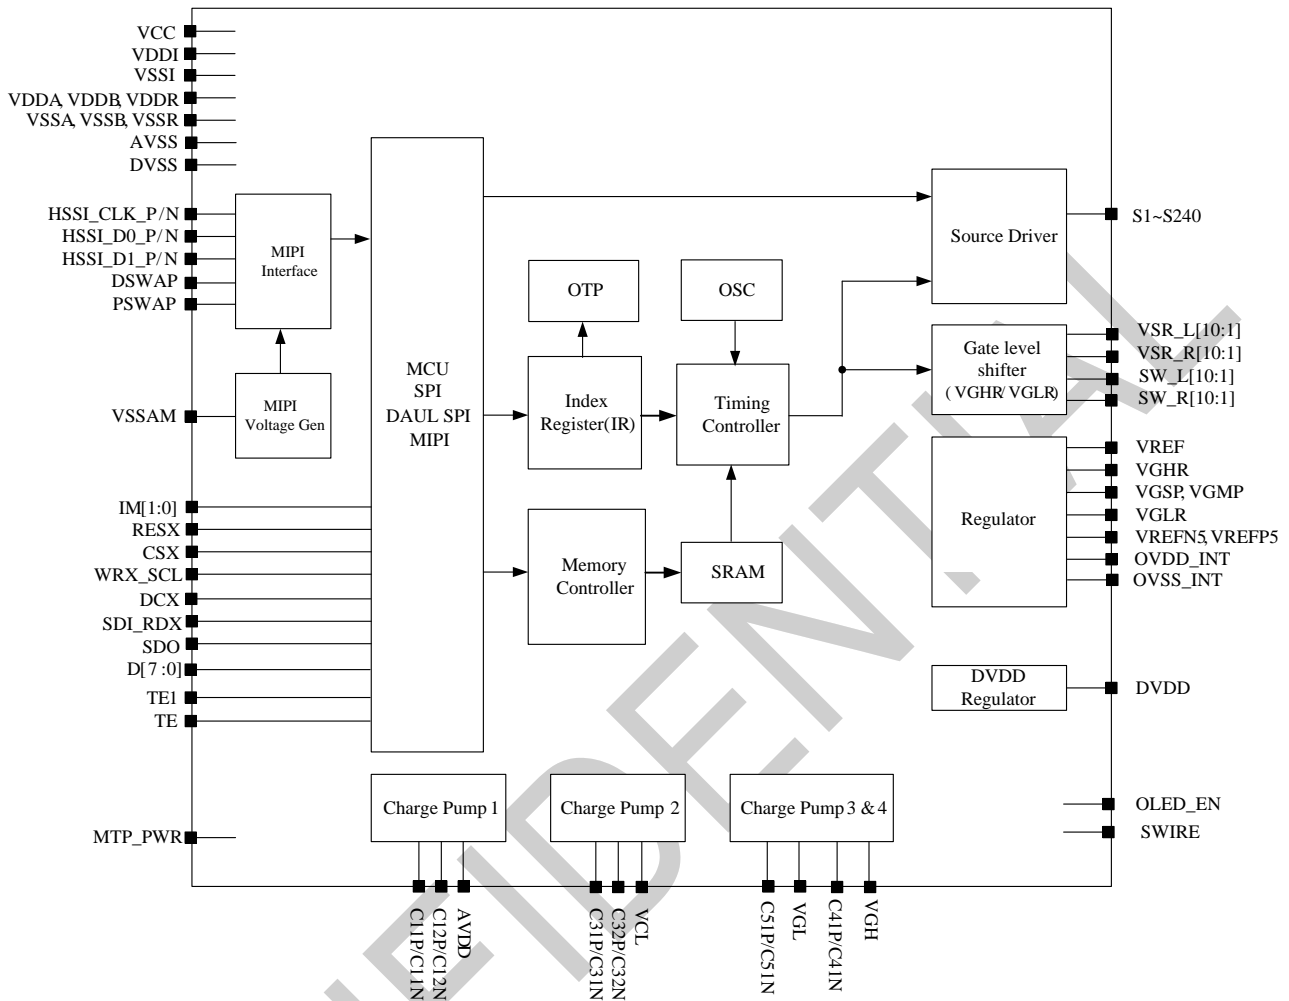

- **Single chip AMOLED controller/driver with display RAM**
- **Display resolution option**
  - 480RGB x 480
  - 400RGB x 400
  - 360RGB x 480
  - 320RGB x 320
  - 320RGB x 480
  - 272RGB x 480
  - 240RGB x 240
  - 240RGB x 320
  - 180RGB x 360
  - 180RGB x 540
  - 128RGB x 432
- **Display data RAM (frame memory): 2,764,800 bits**
- **Display mode (Color mode)**
  - Normal mode: 16.7M-colors, 4096-colors, 8-colors
  - Idle mode: 16.7M-colors, 4096-colors, 8-colors
- **Interface**
  - 8-bits 80-series MPU interface
  - Serial peripheral interface (SPI)
  - Dual serial peripheral interface (Dual-SPI)
  - MIPI Display Serial Interface (1 clock and 2 data lane pairs)
    - ◆ Support 1lane/2lane (1lane: 500Mbps)
    - ◆ Maximum total bit rate is 500Mbps of 2 data lanes 24-bit data format/ 360Mbps of 2 data lanes 18-bit data format/ 320Mbps of 2 data lanes 16-bit data format
- **Interface pixel format**
  - MIPI: RGB888/ RGB666/ RGB565
  - SPI: RGB888/ RGB666/ RGB565/ RGB332/ RGB111/ Gray 256.
- **Abundant color display and drawing functions**
  - Programmable  $\gamma$ -correction function for 16.7 million color display
  - Individual gamma correction setting for RGB dots
  - Partial display function
- **Sunlight readable**
- **Control power IC by one-wire interface**
- **On chip**
  - VREFP5/VREFN5 voltage generator for panel voltage
  - VGHR/VGLR voltage for gate control signal
  - Internal oscillator for display clock
  - Source output MUX 1-6 with 240ch source output pins
  - Supports gate control signals to gate driver in the panel

- Built-in OTP function to adjust panel setting
- Logic / interface power supply voltage VDDI = 1.65V ~ 3.3V
- Analog power supply voltage VDD = 2.7V ~ 3.6V
- Output voltage levels
  - Positive gate driver voltage range for VGHR: 3 ~ 10.5V (Max<=VGH-0.3v)
  - Negative gate driver voltage range for VGLR: -2V ~ -9.5V (Min>=VGL+0.3v)
  - VREFP5 panel voltage range : 0~5V (Max<=AVDD-0.3v)
  - VREFN5 panel voltage range : -0.5~-4.5V (Min>=VCL+0.3v)
  - Step-up 1,2 output voltage range for AVDD: 4.5 ~ 6.5V, VCL: -3.5 ~ -5.0V
  - Gamma high/low voltage range for VGMP: 2.0V ~ 6.3V (Max<=AVDD-0.2v) , VGSP: 0V, 0.2125V ~ 4.5V
  - OVDD\_INT/OVSS\_INT voltage range for idle mode application:  
OVDD\_INT : 2.4V ~ 4.9V (Max<=AVDD-0.3V)  
OVSS\_INT : 0V, -0.4V ~ -4.7V (Min>=VCL+0.3V)
- Package: COF/COG
- Chip size evaluation : 8300um x 2060um(including scribe line)

## ■ Power Supply Specifications

No.	Item		Description
1	Source Driver		240 pins (480 x RGB)
2	gate control timing Level shift		VGHR-VGLR
3	Input Voltage	VDDI	1.65 ~ 3.3V
		VCC	Connect to VDDI or VDD(VCI)
		VDD (VDDA/VDDDB/VDDR)	2.70 ~ 3.60V
4	OLED drive voltages	AVDD	4.5V ~ 6.5V
		VGHR	3V ~ 10.5V (Max<=VGH-0.3v)
		VGLR	-2V ~ -9.5V (Min>=VGL+0.3v)
		VREFP5	0V ~ 5V (Max<=AVDD-0.3v)
		VREFN5	-0.5V ~ -4.5V (Min>=VCL+0.3v)
		OVDD_INT	2.4~4.9v (Max<=AVDD-0.3v)
		OVSS_INT	-0.4 ~ -4.7V (Min>=VCL+0.3v)
5	Internal step-up circuits	AVDD	VCI x2.0(dual), x3.0(single)
		VCL	VCI x -1.0(dual), x-2.0(single)
		VGH	VCI x2, x3, x4
		VGL	VCI x-2, x-3, x-4

### 3. Block Diagram

#### Interface

The RM69092 supports MIPI DSI interface. MIPI DSI can access both internal command and display data.

#### Grayscale Voltage Generating Circuit

Grayscale voltage generating circuit generates a drive voltage, which corresponds to grayscale level set in the y correction register. The RM69092 displays 16.7M colors at the maximum.

#### Power Supply Circuit

The power supply circuit generates supply voltages to OLED panel, VGH, VGL.

#### Timing Generating

The timing controller generates timing signals for internal circuits such as the display timing.

#### Oscillator

The RM69092 incorporates RC oscillator circuit. The frame frequency is changeable by command settings.

#### Panel Driver Circuit

The OLED display driver circuit consists of 240 source drivers (S1~S240). The gate signal consists of VSR\_R/L[1:10], SW\_R/L[1:10] and outputs either VGHR or VGLR level.

## 4. Pin Description

### 4.1 Power Supply Pins

Signal	I/O	Function
Vddb	P	Power supply for DC/DC converter Vddb, Vdda and Vddr should be the same input voltage level
Vdda	P	Power supply for analog system. Vddb, Vdda and Vddr should be the same input voltage level
Vddr	P	Power supply for regulator system Vddb, Vdda and Vddr should be the same input voltage level
Vddi	P	Power supply for interface system except MIPI interface.
Vcc	P	Power supply for DVDD regulator
Vssb	P	System ground for DC/DC converter
Vssa	P	System ground for analog system
Vssr	P	System ground for regulator system
Vssam	P	System ground for internal MIPI analog system
Vssi	P	System ground for interface system except MIPI interface
Dvss	P	System ground for internal digital system
Avss	P	System ground for source OP system.
MTP_PWR	P	MTP programming power supply pin (7.5V typical) Must be left open or connected to DVSS in normal condition.

**4.2 Interface Pins**

Signal	I/O	Function
CSX	I	Chip select input pin ("Low" enable) in 80-series MPU I/F and SPI I/F. If not used, please connect to VDDI.
WRX_SCL	I	WRX : Writes strobe signal to write data when WRX is "Low" in 80-series MPU I/F. SCL: A synchronous clock signal in SPI I/F. If not used, please connect to VSSI.
D/CX	I	Display data / command selection in 80-series MPU I/F and 4-wire SPI I/F. D/CX = "0" : Command D/CX = "1" : Display data or Parameter If not used, please connect to VSSI.
SDI_RDX	I/O	SDI: Serial input signal in SPI I/F. The data is input on the rising edge of the SCL signal. RDX : Reads strobe signal to write data when RDX is "Low" in 80-series MPU interface. If not used, please leave it Open.
SDO	O	Serial output signal in SPI I/F. The data is output on the rising/falling edge of the SCL signal. If the host places the SDI line into high-impedance state during the read interval, the SDI and SDO can be tied together. If not used, please open this pin.
D[7:0]	I/O	8-bit bi-directional data bus for 80-series MPU I/F and 8-bit input data bus for RGB I/F. These pins are not used for SPI, MIPI, please leave it Open.

## 4.3 MIPI Interface Pins

Signal	I/O	Function																																			
HSSI_CLK_P HSSI_CLK_N	I	-These pins are DSI-CLK+/- differential clock signals if MIPI interface is used. -If not used, please connect these pins to VSSAM.																																			
HSSI_D0_P HSSI_D0_N	I/O	-These pins are DSI-D0+/- differential data signals if MIPI interface is used. -If not used, please connect these pins to VSSAM.																																			
HSSI_D1_P HSSI_D1_N	I/O	-These pins are DSI-D1+/- differential data signals if MIPI interface is used. -If not used, please connect these pins to VSSAM.																																			
DSWAP PSWAP	I	Input pin to select HSSI_D0/D1 data lane sequence and polarity in high speed interface only.																																			
		<table><tr><th>Pin Name</th><th>HSSI_D0_P</th><th>HSSI_D0_N</th><th>HSSI_CLK_P</th><th>HSSI_CLK_N</th><th>HSSI_D1_P</th><th>HSSI_D1_N</th></tr><tr><td>DSWAP=0 PSWAP=0</td><td>DSI D0+</td><td>DSI D0-</td><td>DSI CLK+</td><td>DSI CLK-</td><td>DSI D1+</td><td>DSI D1-</td></tr><tr><td>DSWAP=0 PSWAP=1</td><td>DSI D0-</td><td>DSI D0+</td><td>DSI CLK-</td><td>DSI CLK+</td><td>DSI D1-</td><td>DSI D1+</td></tr><tr><td>DSWAP=1 PSWAP=0</td><td>DSI D1+</td><td>DSI D1-</td><td>DSI CLK+</td><td>DSI CLK-</td><td>DSI D0+</td><td>DSI D0-</td></tr><tr><td>DSWAP=1 PSWAP=1</td><td>DSI D1-</td><td>DSI D1+</td><td>DSI CLK-</td><td>DSI CLK+</td><td>DSI D0-</td><td>DSI D0+</td></tr></table>	Pin Name	HSSI_D0_P	HSSI_D0_N	HSSI_CLK_P	HSSI_CLK_N	HSSI_D1_P	HSSI_D1_N	DSWAP=0 PSWAP=0	DSI D0+	DSI D0-	DSI CLK+	DSI CLK-	DSI D1+	DSI D1-	DSWAP=0 PSWAP=1	DSI D0-	DSI D0+	DSI CLK-	DSI CLK+	DSI D1-	DSI D1+	DSWAP=1 PSWAP=0	DSI D1+	DSI D1-	DSI CLK+	DSI CLK-	DSI D0+	DSI D0-	DSWAP=1 PSWAP=1	DSI D1-	DSI D1+	DSI CLK-	DSI CLK+	DSI D0-	DSI D0+
		Pin Name	HSSI_D0_P	HSSI_D0_N	HSSI_CLK_P	HSSI_CLK_N	HSSI_D1_P	HSSI_D1_N																													
		DSWAP=0 PSWAP=0	DSI D0+	DSI D0-	DSI CLK+	DSI CLK-	DSI D1+	DSI D1-																													
		DSWAP=0 PSWAP=1	DSI D0-	DSI D0+	DSI CLK-	DSI CLK+	DSI D1-	DSI D1+																													
		DSWAP=1 PSWAP=0	DSI D1+	DSI D1-	DSI CLK+	DSI CLK-	DSI D0+	DSI D0-																													
DSWAP=1 PSWAP=1	DSI D1-	DSI D1+	DSI CLK-	DSI CLK+	DSI D0-	DSI D0+																															
If not used, please connect to VSSI.																																					

**NOTE:** “1” = VDDI level, “0” = VSSI level.

## 4.4 Interface Logic Pins

Signal	I/O	Function															
RESX	I	This signal will reset the device and must be applied to properly initialize the chip. Signal is active low.															
IM[1:0]	I	Interface type selection. The connections of IM[1:0] which not shown in table are invalid. <table><tr><th>IM[1:0]</th><th>Display Data</th><th>Command</th></tr><tr><td>00</td><td>MIPI / 3-wire SPI</td><td>MIPI / 3-wire SPI</td></tr><tr><td>01</td><td>MIPI / 4-wire SPI</td><td>MIPI / 4-wire SPI</td></tr><tr><td>10</td><td>MIPI / QAD-SPI</td><td>MIPI / QAD-SPI</td></tr><tr><td>11</td><td>MCU 8-bit</td><td>MCU 8-bit</td></tr></table>	IM[1:0]	Display Data	Command	00	MIPI / 3-wire SPI	MIPI / 3-wire SPI	01	MIPI / 4-wire SPI	MIPI / 4-wire SPI	10	MIPI / QAD-SPI	MIPI / QAD-SPI	11	MCU 8-bit	MCU 8-bit
IM[1:0]	Display Data	Command															
00	MIPI / 3-wire SPI	MIPI / 3-wire SPI															
01	MIPI / 4-wire SPI	MIPI / 4-wire SPI															
10	MIPI / QAD-SPI	MIPI / QAD-SPI															
11	MCU 8-bit	MCU 8-bit															
BSTM	I	Boost mode selection pin. <table><tr><th>BSTM</th><th>Mode</th></tr><tr><td>0</td><td>2 PWR(VDDI, VCI) AVDD --&gt; internal CP VCL --&gt; internal CP</td></tr><tr><td>1</td><td>Reserved</td></tr></table>	BSTM	Mode	0	2 PWR(VDDI, VCI) AVDD --> internal CP VCL --> internal CP	1	Reserved									
BSTM	Mode																
0	2 PWR(VDDI, VCI) AVDD --> internal CP VCL --> internal CP																
1	Reserved																
TE	O	Tearing effect output pin to synchronize MCU to frame writing, activated by S/W command. When this pin is not activated, this pin is output low. If not used, please open this pin.															
TE1	O	1. Tearing effect output pin to synchronize MCU to frame writing, activated by S/W command. (Same as TE) 2. IC Status active reporting pin.															
SWIRE	O	Swire protocol setting pin of Power IC, If not used, please open this pin.															
OLED_EN	O	Power IC enable control pin, If not used, please open this pin.															

**NOTE:** "1" = VDDI level, "0" = VSSI level.

## 4.5 Driver Output Pins (Pins for Panel)

Signal	I/O	Function
S1 ~ S240	O	Pixel electrode driving output.
SDMY[1] ~ SDMY[21]	O	Dummy Source, leave it Open.
VSR_L[10:1] VSR_R[10:1]	O	VSR control signals, Level shift output, (VGHR-VGLR)
SW_L[10:1] SW_R[10:1]	O	VSR control signals, Level shift output, (VGHR-VGLR)

CONFIDENTIAL

## 4.6 DC/DC Convert Pins

Signal	I/O	Function
AVDD	O	Output voltage from step-up circuit 1, generated from VDDB. Connect a capacitor for stabilization.
VCL	O	Output voltage from step-up circuit 3, generated from VDDB. Connect a capacitor for stabilization.
VGH	O	Output voltage from step-up circuit 4. Connect a capacitor for stabilization.
VGL	O	Output voltage from step-up circuit 5. Connect a capacitor for stabilization.
C11P, C11N C12P, C12N	IO	Capacitor connection pins for the step-up circuit which generate AVDD. Connect capacitor as requirement. When not in used, please open these pins.
C31P, C31N C32P, C32N	IO	Capacitor connection pins for the step-up circuit which generate VCL. Connect capacitor as requirement.
C41P, C41N	IO	Capacitor connection pins for the step-up circuit which generate VGH. Connect capacitor as requirement.
C51P, C51N	IO	Capacitor connection pins for the step-up circuit which generate VGL. Connect capacitor as requirement.
OVDD_INT	O	Positive output voltage generated from AVDD. LDO output used for OLED panel display. Connect a capacitor for stabilization. When not in use, please open this pin.
OVSS_INT	O	Negative output voltage generated from VCL. LDO output used for OLED panel display Connect a capacitor for stabilization. When not in use, please open this pin.
VGHR	O	Output voltage generated from VGH. LDO output used for panel voltage. Connect a capacitor for stabilization. When not in use, please open this pin.
VGLR	O	Output voltage generated from VGL. LDO output used for panel voltage. Connect a capacitor for stabilization. When not in use, please open this pin.
VGMP	O	Output voltage generated from AVDD. LDO output for positive gamma high voltage generator.
VGSP	O	Output voltage generated from AVDD. LDO output for positive gamma low voltage generator.
VREF	O	Regulator output for internal reference voltage. Connect capacitor for stabilization.
DVDD	O	Regulator output for logic system power. Connect a capacitor for stabilization.
VREFP5	O	Regulator output for VREFP(0~5V)
VREFN5	O	Regulator output for VREFP(-0.5~-5V)

**4.7 Test Pins**

Signal	I/O	Function
ANALOG_TEST 1~2	O	Test pin, not accessible to user. Must be left open.
TEST1~3	IO	Test pin, not accessible to user. Must be left open.
TESTEN	I	Test pin, not accessible to user. Must be left open., Internal pull low
EXTCLK	I	Test pin, not accessible to user. Must be left open.
DUMMY	I	Dummy PAD, leave it open

## 5. Function Description

### 5.1 Interface Type Selection

Interface type selection. The connections of IM[1:0] which not shown in table are invalid.

IM[1:0]	Display Data	Command
00	MIPI / 3-wire SPI	MIPI / 3-wire SPI
01	MIPI / 4-wire SPI	MIPI / 4-wire SPI
10	MIPI / QAD-SPI	MIPI / QAD-SPI
11	MCU 8-bit	MCU 8-bit

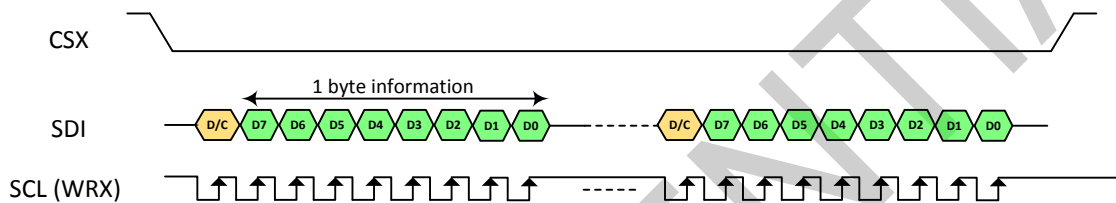

## 5.2 Three-wire/four-wire SPI Interface

### 5.2.1 Write Cycle and Sequence

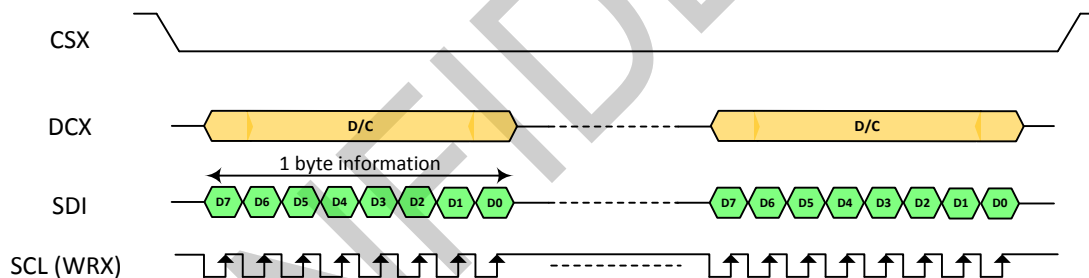

During a write cycle, the host processor sends a series bit string of either command or display data to the display module via the interface. The 3-wire SPI utilizes CSX, SCL, and SDA for data transmission. As to 4-wire SPI, DCX is a must for the host to indicate whether the input information is data/parameter or command.

The write sequence is initiated when CSX is driven from high to low and ends when CSX is pulled high. SCL is driven from high to low then pulled back to high during the write cycle for the data latch. Therefore, the host must transmit valid information on the rising edge of SCL with enough setup time and hold time. DCX is driven low while command is input and pulled to high while input information are data/parameter. The 3-wire/4-wire SPI interface write command sequences are illustrated in the following figures.

#### 3-Wire SPI (9-Bits) - Write

#### 4-Wire SPI (8-Bits) - Write

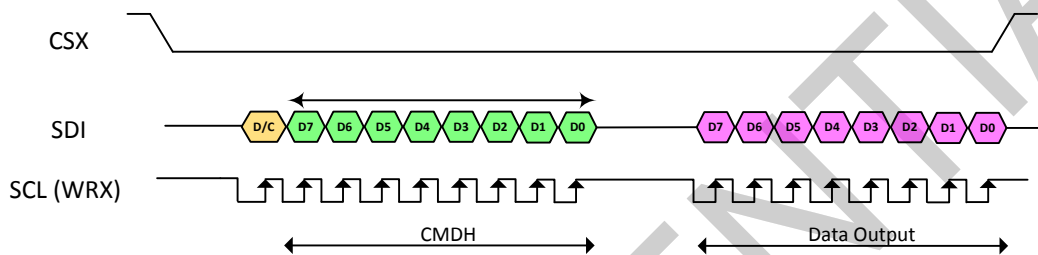

## 5.2.2 Read Cycle and Sequence

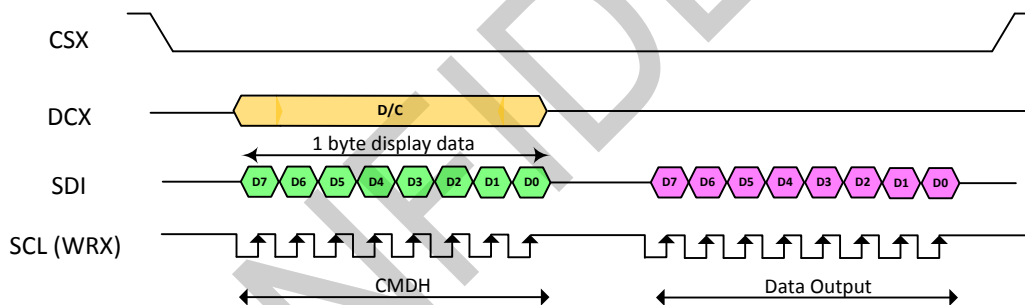

During a read cycle, the host reads a single bit of data from the display module via the interface. The 3-wire/4-wire SPI interface utilizes CSX, SCL and SDA for data transmission. SCL is driven from high to low then pulled back to high during the read cycle. The display module provides readout information during the read cycle while the host reads the display module information back on the rising edge of SCL. The read sequence is initiated when CSX is driven from high to low and ends when CSX is pulled high. The 3-wire/4-wire SPI interface read command sequences are described in the following figure.

There is one restriction for the read operation of this interface, and that is, not all data can be readout. Only the data with the following address in the DCS can be read, and they are 0Ah, 0Bh, 0Ch, 0Dh, 0Eh, 0Fh, DAh, DBh, DCh, 52h, 54h, 59h, 64h, AAh, AFh, DAh, DBh, DCh, E1h, E2h, and E3h. An extra dummy clock as depicted in the following is necessary for those multi-parameter addresses such as 04h, 45h, A1h, and A8h.

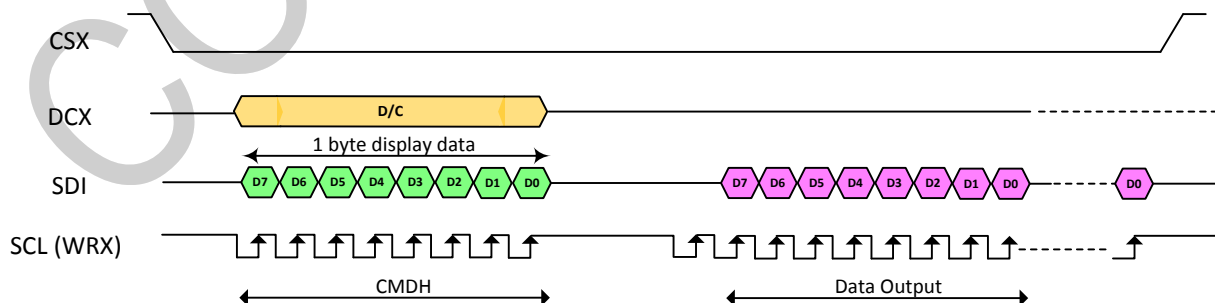

### 3-Wire SPI (9-Bits) - Read

### 4-Wire SPI (8-Bits) - Read (Single Parameter)

### 4-Wire SPI (8-Bits) - Read (Multi Parameters)

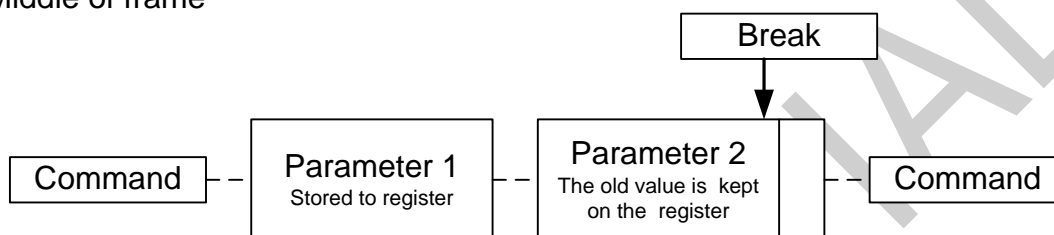

## 5.2.3 Break and Pause Sequence

The host processor can break a read or write sequence by pulling the CSX signal high during a command or data byte. The display module shall reset its interface so it will be ready to receive the same byte when CSX is again driven low.

The host processor can pause a read or write sequence by pulling the CSX signal high between command or data bytes. The display module shall wait for the host processor to drive CSX low before continuing the read or write sequence at the point where the sequence was paused.

### 1. Middle of frame

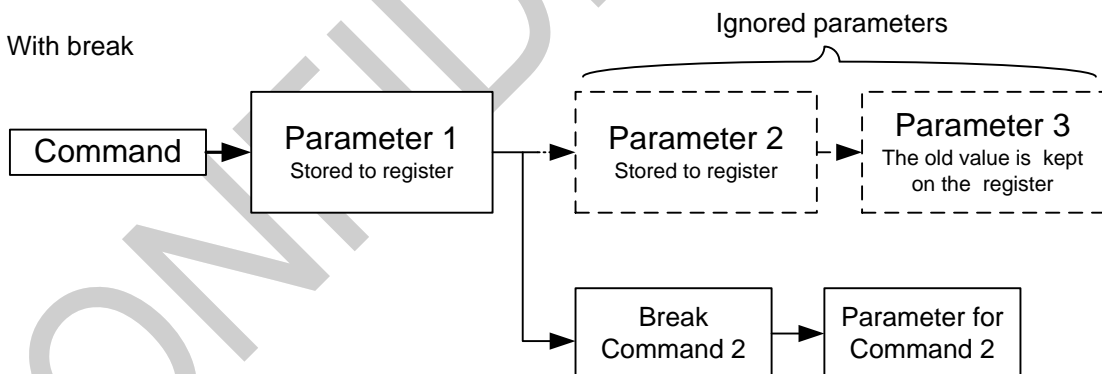

### 2. Between frames

Without break

With break

Break can be e.g. another command or noise pulse.

### 5.3 Display Serial Interface (DSI)

DSI-compliant peripherals support either of two basic modes of operation: Command Mode and Video Mode. The mode definitions reflect the primary intended use of DSI for display interconnect, but are not intended to restrict DSI from operating in other applications.

RM69092 is capable of both Command Mode operation and Video Mode operation. Command Mode refers to operation in which transactions primarily take the form of sending commands and data to a display module that incorporates a display controller. The display controller may include local registers and a frame buffer. Systems using Command Mode write to, and read from, the registers and frame buffer memory. The host processor indirectly controls activity at the peripheral by sending commands, parameters and data to the display controller.

The host processor can also read display module status information or the contents of the frame memory. Command Mode operation requires a bidirectional interface. Video Mode refers to operation in which transfers from the host processor to the peripheral take the form of a real-time pixel stream. In normal operation, the display module relies on the host processor to provide image data at sufficient bandwidth to avoid flicker or other visible artifacts in the displayed image. Video information should only be transmitted using High Speed Mode.

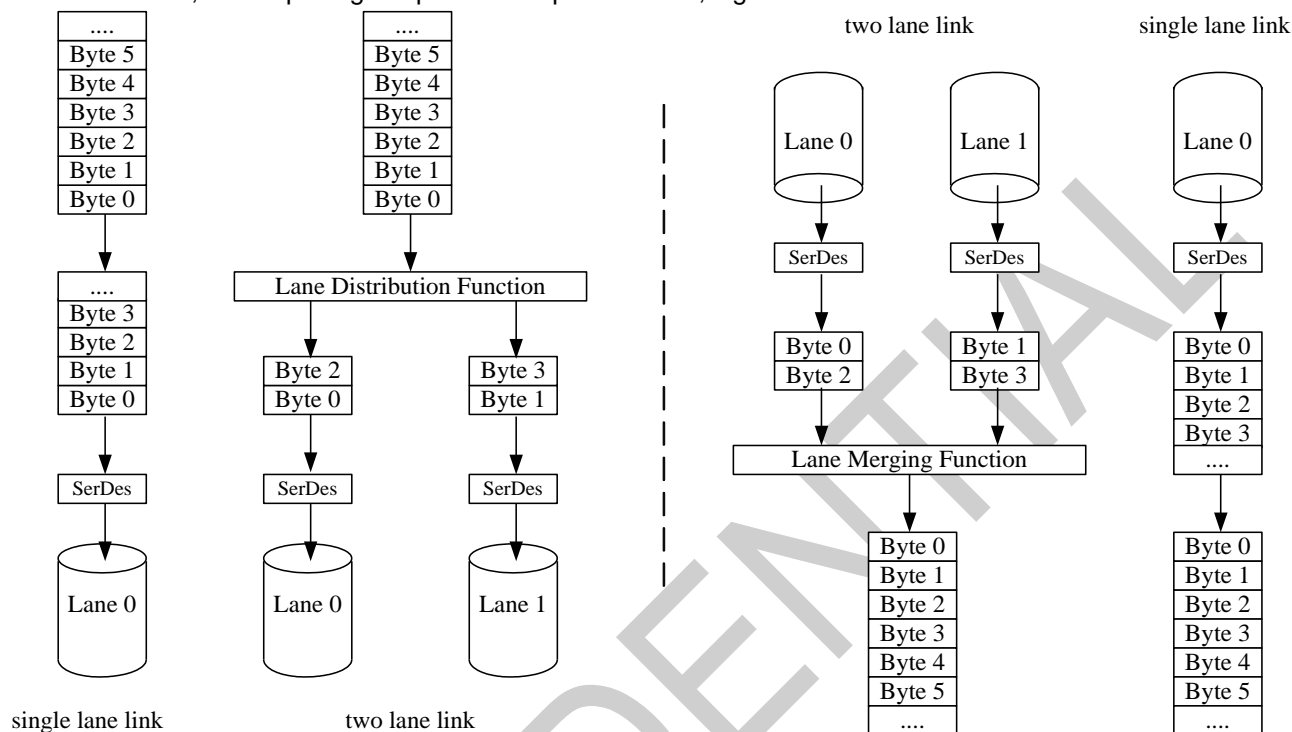

RM69092 Video Mode architectures also include a simple timing controller and partial frame buffer, used to maintain a partial-screen or lower-resolution image in standby or Low Power Mode. This permits the interface to reduce power consumption.

RM69092 Configuration:

Lane Pair	MCU(Master) RM69092(Slave)
Clock Lane	Unidirectional Lane Clock only
Data Lane 0	Bi-directional Lane Forward High-speed Bi-directional Escape Mode Bi-directional LPDT
Data Lane 1	Unidirectional Lane Forward High-Speed Escape Mode No LPDT

## 5.3.1 DSI Protocol

On the transmitter side of a DSI Link, parallel data, signal events, and commands are converted to packets. These packets are sent across the serial Link. The receiver side of a DSI Link performs the converse of the transmitter side, decomposing the packet into parallel data, signal events and commands.

There are two kinds of packets, **short packet** and **long packet**.

Short packet structure:

LP-11: low power mode

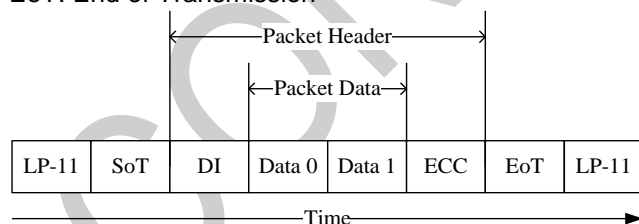

SoT: start of transmission

DI: data identification

Data 0, Data1: packet data

ECC: error correction code

EoT: End of Transmission

DI structure:

Virtual Channel: these two bits identify the data as directed to one of four virtual channels

Data Type: It specifies the packet structure and packet format

Virtual Channel (VC)		Data Type (DT)					
Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0

Long packet structure:

LP-11: low power mode

SoT: start of transmission

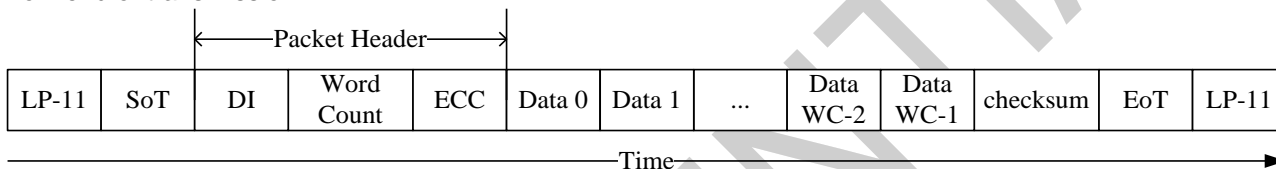

DI: data identification

Word Count: the number of data bytes of packet data

ECC: error correction code

Checksum: The 16-bit CRC generator to check packet data. If the calculated checksum of receiver are equal to the packet data, the packet data is correct. If the calculated checksum of receiver are not equal, the packet data are not correct.

EoT: end of transmission

### 5.3.2 Processor to Peripheral Transactions

#### Processor to Peripheral Direction Packet Data Types

Data Type	Data Type binary	Description	Packet Size
01h	00 0001	Sync Event, V Sync Start	Short
11h	01 0001	Sync Event, V Sync End	Short
21h	10 0001	Sync Event, H Sync Start	Short
31h	11 0001	Sync Event, H Sync End	Short
08h	00 1000	End of Transmission packet (EoTp)	Short
02h	00 0010	Color Mode (CM) Off Command	Short
12h	01 0010	Color Mode (CM) On Command	Short
22h	10 0010	reserved	Short
32h	11 0010	reserved	Short
03h	00 0011	reserved	Short
13h	01 0011	Generic Short WRITE, 1 parameter	Short
23h	10 0011	Generic Short WRITE, 2 parameters	Short
04h	00 0100	reserved	Short
14h	01 0100	Generic READ, 1 parameter	Short
24h	10 0100	Generic READ, 2 parameters	Short
05h	00 0101	DCS Short WRITE, no parameters	Short
15h	01 0101	DCS Short WRITE, 1 parameter	Short
06h	00 0110	DCS READ, no parameters	Short
37h	11 0111	Set Maximum Return Packet Size	Short
09h	00 1001	Null Packet, no data	Long
19h	01 1001	Blanking Packet, no data	Long
29h	10 1001	Generic Long Write	Long
39h	11 1001	DCS Long Write/write_LUT Command Packet	Long
0Eh	00 1110	Packed Pixel Stream, 16-bit RGB, 5-6-5 Format	Long
1Eh	01 1110	Packed Pixel Stream, 18-bit RGB, 6-6-6 Format	Long
2Eh	10 1110	Loosely Packed Pixel Stream, 18-bit RGB, 6-6-6 Format	Long
3Eh	11 1110	Packed Pixel Stream, 24-bit RGB, 8-8-8 Format	Long

#### Sync Event, Data Type = xx 0001

Sync Events are all short packets and time-accurately. They can perform like the start and end of sync pulses. To represent timing information as accurately as possible, a V Sync Start event represents the start of the VSA and also implies an H Sync Start event for the first line of the VSA. Hence, a V Sync End event implies an H Sync Start event for the last line of the VSA. Sync events may be concatenated with blanking packets to convey inter-line timing accurately and avoid the overhead of switching between LPS and HS for every event. Note there is a power penalty for keeping the data line in HS mode.

#### EoT packet

This short packet is used to indicate the end of a high speed (HS) transmission. This packet will enhance overall system reliability. Although the main objective of the EoTp is to enhance robustness during HS transmission mode, RM69092 can detect and interpret arriving EoTps regardless of transmission mode (HS or LP modes)

#### Color Mode Off / On Command

They are short packet commands to switch video display module between normal display mode and low-color mode for power saving.

#### Generic short write / read packet

Generic Short WRITE command is a Short packet type for sending generic data to the peripheral. Generic READ request is a Short packet requesting data from the peripheral.

#### DCS commands

##### DCS short write command

DCS short write command is used to write a single data byte command to display module. If there is a valid parameter byte, data type bit 4 shall be set to 1. If there is no valid parameter byte, data type bit 4 shall be set to 0 and the parameter byte shall be 00h.

##### DCS read commands

The commands are used to request data from the display module.

##### DCS Long Write / write\_LUT command

The commands are used to send larger blocks of data to a display module.

#### Maximum return packet size

This command specifies the maximum size of the payload in a long packet transmission from a display module to host processor.

#### Null Packet

This is a mechanism for keeping the data lane(s) in high speed mode while sending dummy data.

#### Blanking Packet

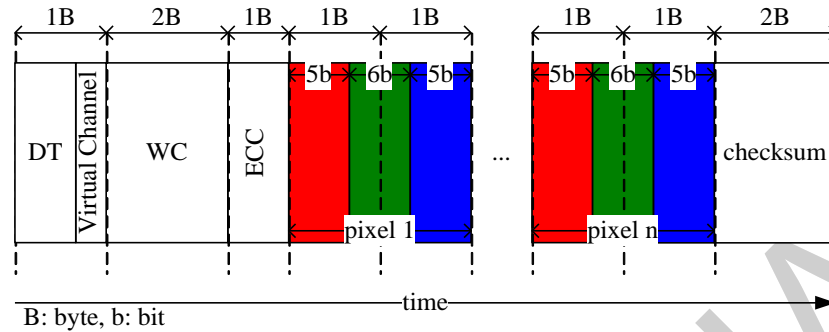

A Blanking packet is used to convey blanking timing information in a Long packet. The packet represents a period between active scan lines of a Video Mode display, where traditional display timing is provided from the host processor to the display module. The blanking period may have Sync Event packets interspersed between blanking segments. Blanking packets may contain arbitrary data as payload.

#### Generic Long Write

This is used to transmit arbitrary blocks of data from a host processor to a peripheral.

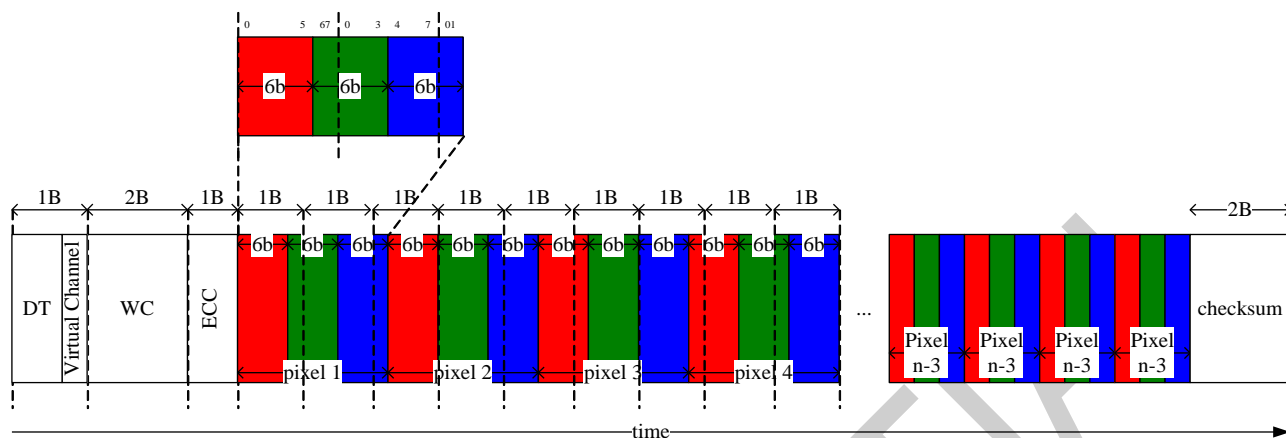

Packed Pixel Stream, 16-bit Format, Data Type: 00 1110

The pixel format is five bits red, six bits green and five bits blue. The green component is split across two bytes. Within a color component, the LSB is sent first, the MSB last.

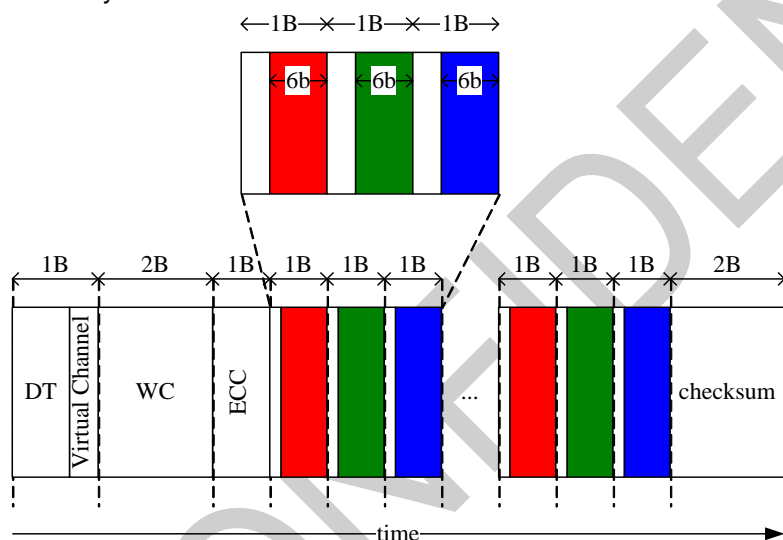

Packet pixel stream, 18-bit format, Data Type: 01 1110

The pixel format is six bits red, six bits green and six bits blue. Within a color component, the LSB is sent first, the MSB last.

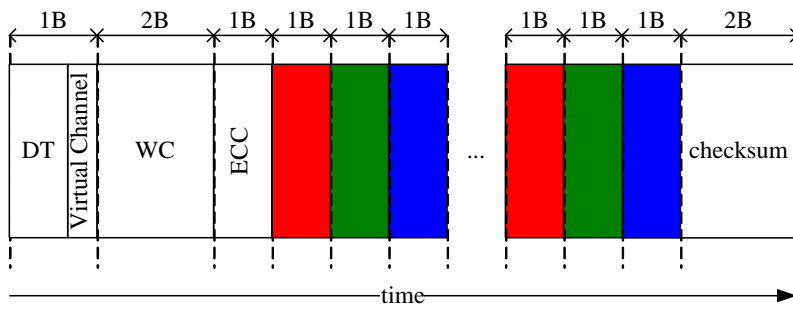

Packet pixel stream, 18-bit format in three bytes, Data Type: 10 1110

This is 18-bit pixel lossely packed format, each R, G or B color component is six bits but shifted to the upper bits of byte.

Packet pixel stream, 24-bit format, Data Type: 11 1110  
The pixel format is eight bits red, eight bits green and eight bits blue.

### 5.3.3 Peripheral-to-Processor LP Transmission

All Command Mode systems require bidirectional capability for returning READ data, acknowledge, or error information to the host processor. Multi-Lane systems shall use Lane 0 for all peripheral-to-processor transmissions. Reverse-direction signaling shall only use low power mode transmission.

Packet structure for peripheral-to-processor transaction is the same as for the processor-to-peripheral direction. For the processor-to-peripheral direction, two basic packet formats are the same as the peripheral-to-processor direction: Short and Long packet structure. BTA shall take place after every peripheral-to-processor transaction. This returns bus control to the host processor following the completion of the LP transmission from the peripheral.

There are four basic types of peripheral-to-processor transactions.

**Tearing Effect:** It is a Trigger message sent to convey display timing information to the host processor.

**Acknowledge:** It is a Trigger Message sent when the current transmission, as well as all preceding transmissions since the last peripheral to host communication.

**Acknowledge and Error Report:** It is a Short packet sent if any errors were detected in preceding transmissions from the host processor.

**Response to Read Request:** It may be a Short or Long packet that returns data requested by the preceding READ command from the processor.

Interpretation of processor-to-peripheral transactions with BTA asserted, and the expected responses, are as follows:

Following a non-Read command: If no errors were detected, the peripheral shall respond with Acknowledge.

Following a Read request: The peripheral shall send the requested READ data if no errors were detected and stored since the last peripheral to host communication.

Following a Read request: If only a single-bit ECC error was detected and corrected, the peripheral shall send the requested READ data in a Long or Short packet and a 4-byte Acknowledge and Error Report packet in the same LP transmission.

Following a non-Read command: If only a single-bit ECC error was detected and corrected, the peripheral shall respond to BTA by sending a 4-byte Acknowledge and Error Report packet.

Following a Read request: If multi-bit ECC errors were detected and not corrected, the peripheral shall send a 4-byte Acknowledge and Error Report packet without sending Read data.

Following a non-Read command: If multi-bit ECC errors were detected and not corrected, the peripheral shall not execute the command, and shall send a 4-byte Acknowledge and Error Report packet.

Following any command: If SoT Error, SoT Sync Error, the VC of DSI or the ID of DSI Invalid or DSI protocol violation was detected, or the DSI command was not recognized, the peripheral shall send a 4-byte Acknowledge and Error Report response.

Following any command: If EoT Sync Error or LP Transmit Sync Error is detected, or a checksum error is detected in the payload, the peripheral shall send a 4-byte Acknowledge and Error Report packet.

**5.3.4 Error Report Format**

The following table shows the bit assignment for all error report.

Bit	Description
0	SoT Error
1	SoT Sync Error
2	EoT Sync Error
3	Escape Mode Entry Command Error
4	Low-Power Transmit Sync Error
5	HS Receive Timeout Error
6	False Control Error
7	Reserved
8	ECC Error, single-bit (detected and corrected)
9	ECC Error, multi-bit (detected, not corrected)
10	Checksum Error (Long packet only)
11	DSI Data Type Not Recognized
12	DSI VC ID Invalid
13	reserved
14	reserved
15	reserved

### 5.3.5 Peripheral-to-Processor Transaction – Detail Format Description

The following list is the complete set of peripheral-to-processor data types.

Data type, hex	Data type binary	Description	Packet size
02h	00 0010	Acknowledge and error report	short
08h	00 1000	reserved	short
11h	01 0001	GEN short read reponse, 1byte returned	short
12h	01 0010	GEN short read reponse, 2bytes returned	short
1Ah	01 1010	Generic long read reponse	long
1Ch	01 1100	DCS long read reponse	long
21h	10 0001	DCS short read reponse, 1byte returned	short
22h	10 0010	DCS short read reponse, 2bytes returned	short

**Acknowledge and error report:** It is sent with BTA asserted when a reportable error is detected in the preceding, or earlier, transmission from the host processor.

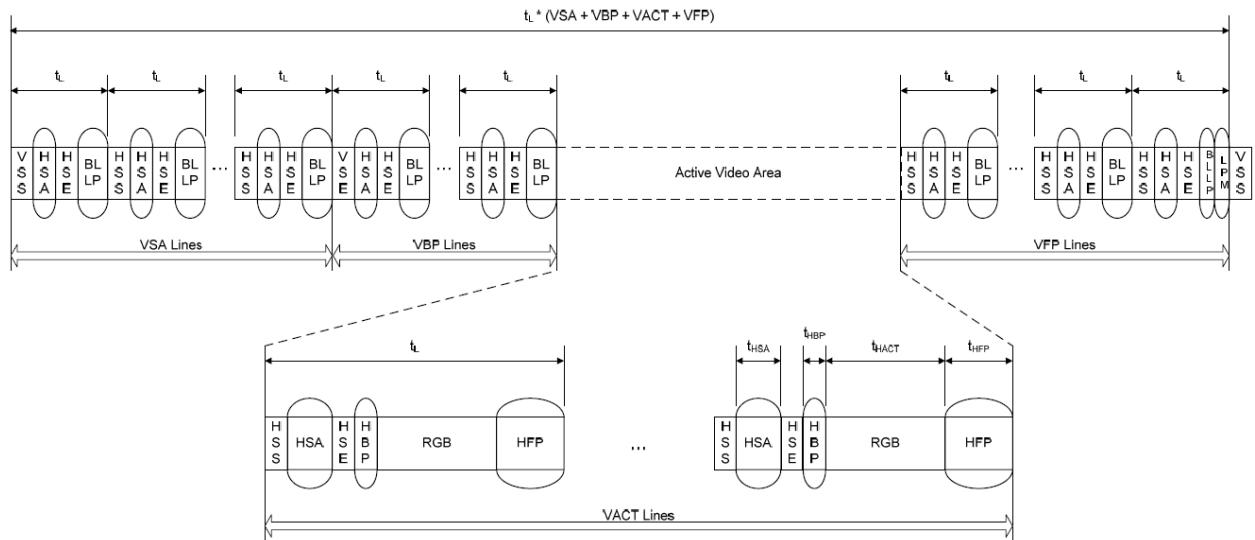

**Generic Short Read Response:** This is the short-packet response to Generic READ Request. Packet composition is the Data Identifier (DI) byte, two bytes of payload data and an ECC byte. If the command itself is possibly corrupt, due to an uncorrectable ECC error, SoT or SoT Sync error, the requested READ data packet shall not be sent and only the Acknowledge and Error Report packet shall be sent.

**Generic long read reponse:** This is the long-packet response to Generic READ Request. Packet composition is DI followed by a two-byte Word Count, an ECC byte, N bytes of payload, and a two-byte Checksum. If the command itself is possibly corrupt, due to an uncorrectable ECC error, SoT or SoT Sync error, the requested READ data packet shall not be sent and only the Acknowledge and Error Report packet shall be sent.

**DCS long read reponse:** This is a Long packet response to DCS Read Request. Packet composition is DI followed by a two-byte Word Count, an ECC byte, N bytes of payload, and a two-byte Checksum. If the DCS command itself is possibly corrupt, due to uncorrectable ECC error, SoT or SoT Sync error, the requested READ data packet shall not be sent and only the Acknowledge and Error Report packet shall be sent.

**DCS short read reponse:** This is the short-packet response to DCS Read Request. Packet composition is DI, two bytes of payload data and an ECC byte. If the command itself is possibly corrupt, due to an uncorrectable ECC error, SoT or SoT Sync error, the requested READ data packet shall not be sent and only the Acknowledge and Error Report packet shall be sent.

## 5.3.6 DSI Video Mode Interface Timing

### 5.3.7 Error Correction Code (ECC)

ECC shall always be generated and appended in the Packet Header from the host processor. Peripherals with Bidirectional Links shall also generate and send ECC.

The number of parity or error check bits required is given by the Hamming rule, which uses parity to correct a single-bit error or detect a two-bit error, but are not capable of doing both simultaneously. DSI uses Hamming-modified codes where an extra parity bit is used to support both single error correction as well as two-bit error detection.

Since Packet Headers are fixed at four bytes (twenty-four data bits and eight ECC bits), P6 and P7 of the ECC byte are unused and shall be set to zero by the transmitter. The receiver shall ignore P6 and P7 and set both bits to zero before processing ECC.

The parity bits of ECC are defined as below:

$$P7 = 0$$

$$P6 = 0$$

$$P5 = D10 \oplus D11 \oplus D12 \oplus D13 \oplus D14 \oplus D15 \oplus D16 \oplus D17 \oplus D18 \oplus D19 \oplus D21 \oplus D22 \oplus D23$$

$$P4 = D4 \oplus D5 \oplus D6 \oplus D7 \oplus D8 \oplus D9 \oplus D16 \oplus D17 \oplus D18 \oplus D19 \oplus D20 \oplus D22 \oplus D23$$

$$P3 = D1 \oplus D2 \oplus D3 \oplus D7 \oplus D8 \oplus D9 \oplus D13 \oplus D14 \oplus D15 \oplus D19 \oplus D20 \oplus D21 \oplus D23$$

$$P2 = D0 \oplus D2 \oplus D3 \oplus D5 \oplus D6 \oplus D9 \oplus D11 \oplus D12 \oplus D15 \oplus D18 \oplus D20 \oplus D21 \oplus D22$$

$$P1 = D0 \oplus D1 \oplus D3 \oplus D4 \oplus D6 \oplus D8 \oplus D10 \oplus D12 \oplus D14 \oplus D17 \oplus D20 \oplus D21 \oplus D22 \oplus D23$$

$$P0 = D0 \oplus D1 \oplus D2 \oplus D4 \oplus D5 \oplus D7 \oplus D10 \oplus D11 \oplus D13 \oplus D16 \oplus D20 \oplus D21 \oplus D22 \oplus D23$$

The table below shows a compact way to specify the encoding of parity and decoding of syndromes.

ECC Parity Generation Rules:

Data Bit	P7	P6	P5	P4	P3	P2	P1	P0	Hex
0	0	0	0	0	0	1	1	1	0x07
1	0	0	0	0	1	0	1	1	0x0B
2	0	0	0	0	1	1	0	1	0x0D
3	0	0	0	0	1	1	1	0	0x0E
4	0	0	0	1	0	0	1	1	0x13
5	0	0	0	1	0	1	0	1	0x15
6	0	0	0	1	0	1	1	0	0x16
7	0	0	0	1	1	0	0	1	0x19
8	0	0	0	1	1	0	1	0	0x1A
9	0	0	0	1	1	1	0	0	0x1C
10	0	0	1	0	0	0	1	1	0x23
11	0	0	1	0	0	1	0	1	0x25
12	0	0	1	0	0	1	1	0	0x26
13	0	0	1	0	1	0	0	1	0x29
14	0	0	1	0	1	0	1	0	0x2A
15	0	0	1	0	1	1	0	0	0x2C
16	0	0	1	1	0	0	0	1	0x31
17	0	0	1	1	0	0	1	0	0x32
18	0	0	1	1	0	1	0	0	0x34
19	0	0	1	1	1	0	0	0	0x38
20	0	0	0	1	1	1	1	1	0x1F
21	0	0	1	0	1	1	1	1	0x2F
22	0	0	1	1	0	1	1	1	0x37
23	0	0	1	1	1	0	1	1	0x3B

### 5.3.8 Notice

1. We recommend users to stay in STOP state for 500ns when switching from LPDT to HSDT.
2. We recommend users to adopt EoTp to enhance overall robustness of the system during HSDT.

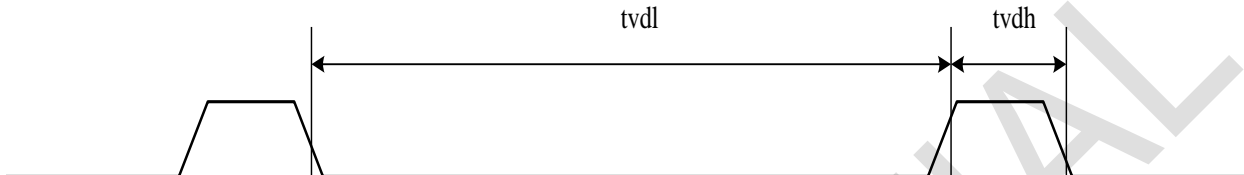

CONFIDENTIAL

## 5.4 Tearing Effect Output

The tearing effect output line supplies to the HOST a panel synchronization signal. This signal can be enabled or disabled by the set\_tear\_off (34h) and set\_tear\_on (35h) commands. The mode of the tearing effect signal is defined by the parameter of the set\_tear\_on (35h) and set\_tear\_scanline(44h) commands. The signal can be used by the HOST to synchronize internal VSYNC when displaying video images.

### 5.4.1 Tearing Effect Line Mode

Mode 1, the tearing effect output signal consist of V-sync information only:

tvdh = Display is not updated from the frame memory.

tvdl = Display is updated from the frame memory.

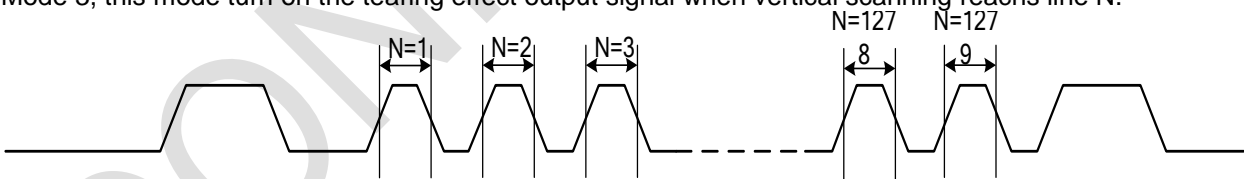

Mode 2, the tearing effect output signal consist of V-sync and H-sync information:

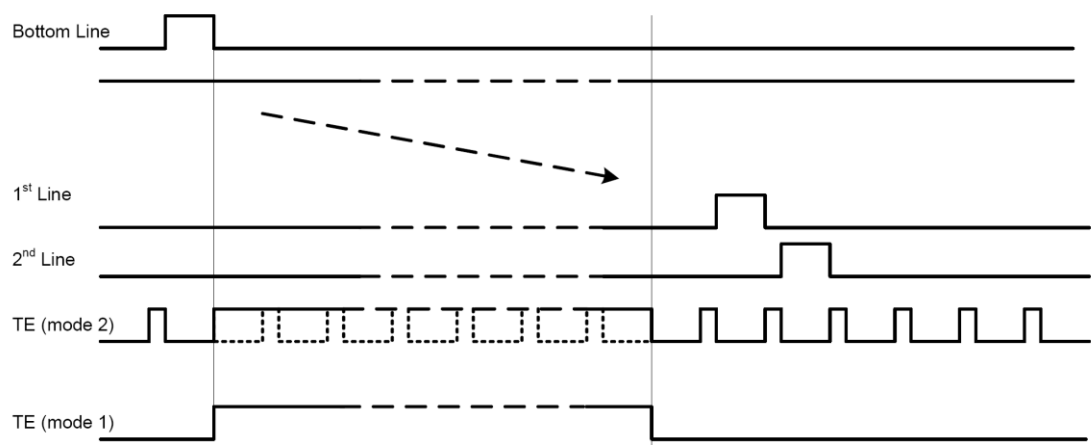

thdh = Display is not updated from the frame memory.

thdl = Display is updated from the frame memory.

Mode 3, this mode turn on the tearing effect output signal when vertical scanning reaches line N.

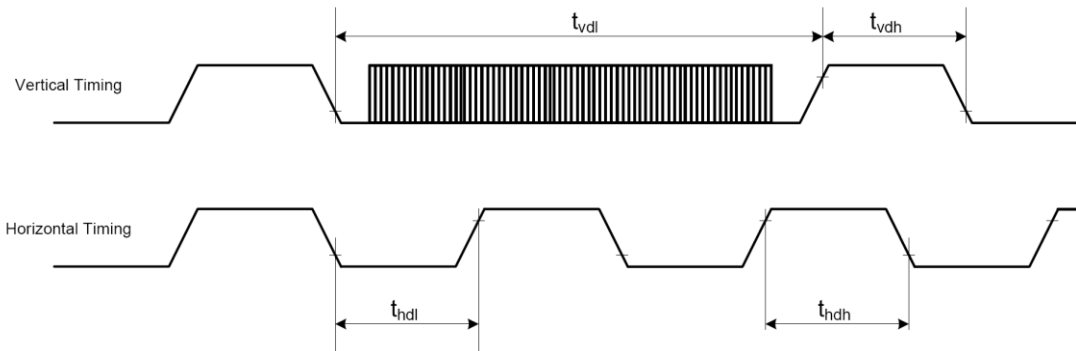

N = The N-th scanning line which set by register N[15:0] of command STESL(44h).

Note. During Sleep In mode, the tearing effect output signal is active low.

## 5.4.2 Tearing Effect Line Timing

The tearing effect signal is described as below:

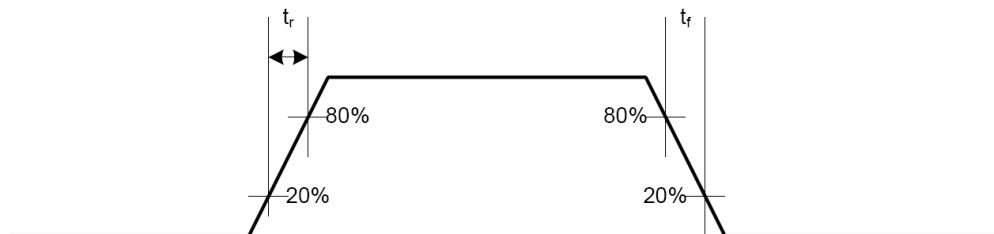

AC characteristics of Tearing Effect Signal (Frame Rate = 60.5Hz)

Symbol	Parameter	Typ.	Unit	Description
tvdl	Vertical timing low duration			1*frame time- tvdh
tvdh	Vertical timing high duration			tvdh =V Porch time if STS[15:0]=0. tvdh =31* line time if STS[15:0] not equal to 0.
thdl	Horizontal timing low duration			1* line time- 32*PCLK
thdh	Horizontal timing high duration	1.45	us	32*PCLK

Notes:

1. The signal's rise and fall times ( $t_r$ ,  $t_f$ ) are stipulated to be equal to or less than 15ns.

The Tearing Effect Output Line is fed back to the HOST and should be used as shown below to avoid tearing effect:

The Tearing Effect output line supplies to the HOST a panel synchronization signal. This signal can be enabled or disabled by the `set_tear_off(34h)`, `set_tear_on(35h)` commands. The mode of the Tearing Effect Signal is defined by the Parameter of the Tearing Effect Line On command. The signal can be used by the HOST to synchronize internal VSYNC when displaying video images.

TEON (35h)	TELOM (35h, 1 <sup>st</sup> bit)	TE signal Output
0	*	GND
1	0	TE (Mode 1)
1	1	TE (Mode 2)

## 6.2 Command Description

### NOP (0000h)

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	0000h	No Argument								

Description	This command is an empty command; it does not have any effect on the display module. X = Don't care.
Restriction	None

### SWRESET(0100h) : Software Reset

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	0100h	No Argument								

Description	When the Software Reset command is written, it causes software reset. It resets the commands and parameters to their S/W Reset default values. (See default tables in each command description.)
Restriction	Software Reset Command cannot be sent during Sleep Out sequence. Any new command cannot be sent for 10-frame period until the RM69092 enters Sleep-In mode. Do not send any command.

## RDDID(0400h~0402h) : Read Display ID

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
R	0400h	ID17	ID16	ID15	ID14	ID13	ID12	ID11	ID10	00
	0401h	ID27	ID26	ID25	ID24	ID23	ID22	ID21	ID20	80
	0402h	ID37	ID36	ID35	ID34	ID33	ID32	ID31	ID30	00

Description	<p>The 1<sup>st</sup> parameter (ID1): the Module's manufacture ID  The 2<sup>nd</sup> parameter (ID2): the Module/driver version ID  The 3<sup>rd</sup> parameter (ID3): the Module/driver ID  Note: Commands RDID1/2/3 (DAh/DBh/DCh) read data correspond to the parameter 1, 2, 3 of command 04h, respectively.</p>									
Restriction	-									

## RDNUMED(0500h) : Read Number of Errors on DSI

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
R	0500h	D7	D6	D5	D4	D3	D2	D1	D0	00

Description	<p>The first parameter is telling a number of the parity errors on DSI. The more detailed description of the bits is below.</p> <p>D[6..0] bits are telling a number of the parity errors.</p> <p>D[7] is set to "1" if there is overflow with D[6..0] bits.</p> <p>D[7..0] bits are set to "0"s (as well as RDDSM(0Eh)'s D0 are set "0" at the same time) after there is sent the first parameter information (= The read function is completed).</p> <p>This command is used for MIPI DSI only. It is no function for others interface operation.</p>
Restriction	-

CONFIDENTIAL

**RDDPM (0A00h) : Read Display Power Mode**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
R	0A00h	D7	D6	D5	D4	D3	D2	D1	D0	08

Description	This command indicates the current status of the display as described in the table below:									
	Bit	Symbol	Description				Comment			
	D7	BSTON	Booster Voltage Status				'1'=Booster on, '0'=Booster off			
	D6	IDMON	Idle Mode On/Off				'1' = Idle Mode On, '0' = Idle Mode Off			
	D5	PTLON	Partial Mode On/Off				'1' = Partial Mode On, '0' = Partial Mode Off			
	D4	SLPON	Sleep In/Out				'1' = Sleep Out, '0' = Sleep In			
	D3	NORON	Display Normal Mode On/Off				'1' = Normal Display, '0' = Partial Display			
	D2	DISON	Display On/Off				'1' = Display On, '0' = Display Off			
	D1	Reserved					0			
	D0	Reserved					0			

**RDDMADCTR (0B00h): Read Display MADCTR**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
R	0B00h	D7	D6	D5	D4	D3	D2	D1	D0	00

Description	This command indicates the current status of the display as described in the table below:									
	Bit	Symbol	Description				Comment			
	D6	MX	Column Address Increment				0: Increasing in horizontal 1: Decreasing in horizontal			
	D3	RGB	RGB/BGR Order				'1' =BGR, "0"=RGB			
	others	Reserved	-				-			

**RDDCOLMOD (0C00h): Read Display Pixel Format**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
R	0C00h	SPI_IF PF SE	VIPF[0]	VIPF[0]	VIPF[0]	0	IFPF[2]	IFPF[1]	IFPF[0]	77

To return the status of 0x3A00.

This command sets the pixel format for the RGB image data used by the interface.

If SPI\_IFPF\_SEL(3Ah-B7) = 1: The VIPF[2:0] pixel format used by the SPI interface

If SPI\_IFPF\_SEL(3Ah-B7) = 0: The IFPF[2:0] pixel format used by the SPI / MCU interface

Control Interface Color Format	IFPF[2]	IFPF[1]	IFPF[0]
SPI 8 bit/pixel (256 colors); SPI 256 Gray (Support IF: SPI3/SPI4)	0	0	1
SPI 8 bit/pixel (256 colors); SPI 3-3-2 (Support IF: SPI3/SPI4)	0	1	0
SPI 3 bit/pixel (8 colors); SPI 1-1-1 (Support IF: SPI3/SPI4)	0	1	1
16bit/pixel (65,536 colors)	1	0	1
18bit/pixel (262,144 colors)	1	1	0
24bit/pixel (16.7M colors)	1	1	1

## RDDIM (0D00h): Read Display Image Mode

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
R	0D00h	D7	D6	D5	D4	D3	D2	D1	D0	00

Description	The display module returns the display image mode status.									
	Bit	Symbol	Description			Comment				
	D7	Reserved				'0'				
	D6	Reserved				'0'				
	D5	INVON	Inversion On/Off			"1" = Inversion is On, "0" = Inversion is Off				
	D4	ALLON	All Pixel On			'0' = Normal display '1' = White display				
	D3	ALLOFF	All Pixel Off			'0' = Normal display '1' = Black display				
	D2~D0	Reserved				'000'				

**RDDSM (0E00h): Read Display Signal Mode**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
R	0E00h	D7	D6	D5	D4	D3	D2	D1	D0	00

Description	The display module returns the Display Signal Mode.			
	Bit	Symbol	Description	Comment
	D7	TEON	Tearing Effect Line On/Off	"1" = On, "0" = Off
	D6	TELOM	Tearing effect line mode	"0" = mode1, "1" = mode2
	D5	Reserved		'0'
	D4	Reserved		'0'
	D3	Reserved		'0'
	D2	Reserved		'0'
	D1	Reserved		'0'
	D0	Error on DSI	Error on DSI	'0' = No Error '1' = Error

**RDDSDR (0F00h): Read Display Self-Diagnostic Result**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
R	0F00h	0	0	0	0	0	0	0	checksum_comp	00

Description	The display module returns the self-diagnostic results following a Sleep Out command.								
	Bit	Symbol	Description				Comment		
	D0	Reserved	checksum_comp				'0'		

**SLPIN (1000h): Sleep In**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	1000h	No Argument								

Description	<p>This command causes the display module to enter the minimum power consumption mode. In this mode the DC/DC converter is stopped, Internal display oscillator is stopped, and panel scanning is stopped. The control Interface such as registers is still working and keeps its values.</p>
Restriction	<p>This command has no effect when the display module is already in Sleep mode. Sleep In Mode can only be exit by the Sleep Out Command (11h). It must wait 5msec before sending next command for the supply voltages and clock circuits to stabilize. It must wait 120msec after sending Sleep Out command (when in Sleep In Mode) before Sleep In command can be sent.</p>

**SLPOUT (1100h): Sleep Out**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	1100h	No Argument								

Description	This command causes the display module to exit Sleep mode.
Restriction	<p>This command shall not cause any visible effect on the display device when the display module is not in Sleep mode. The host processor must wait five milliseconds after sending this command before sending another command. This delay allows the supply voltages and clock circuits to stabilize.</p> <p>The host processor must wait 60 milliseconds after sending a Sleep Out command before sending a Sleep-In command. The display module loads the display module's default values to the registers when exiting the Sleep mode. There shall not be any abnormal visual effect on the display device when loading the registers if the factory default and register values are the same or when the display module is not in Sleep mode. The display module runs the self-diagnostic functions after this command is received.</p>

**PTLON (1200h): Partial Display Mode On**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	1200h	No Argument								

Description	This command causes the display module to enter the Partial Display Mode. The Partial Display Mode window is described by the Partial Area (30h) command. To leave Partial Display Mode, the Normal Display Mode On (13h) command should be written.
Restriction	This command has no effect when Partial Display Mode is already active.

## NORON (1300h): Normal Display Mode On

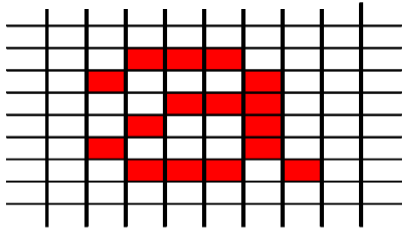

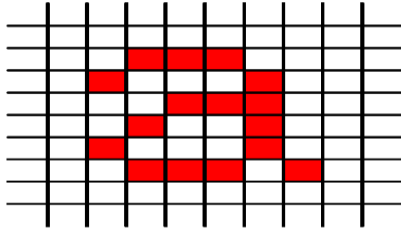

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	1300h	No Argument								

Description	This command causes the display module to enter the Normal mode. Normal Mode is defined as Partial Display mode.
Restriction	This command has no effect when Normal Display mode is already active.

CONFIDENTIAL

## INVOFF (2000H): Display Inversion Off

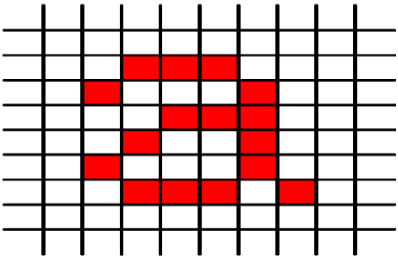

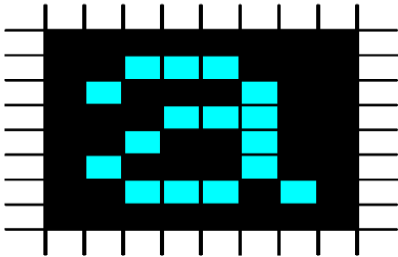

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	2000h	No Argument								

Description	<p>This command causes the display module to stop inverting the image data on the display device. No status bits are changed.</p> <div style="display: flex; align-items: center; justify-content: center;"> <div style="text-align: center;"> <p><b>Input Image</b></p>  </div> <div style="margin: 0 20px;">→</div> <div style="text-align: center;"> <p><b>Display Panel</b></p>  </div> </div>
	<p><b>Restriction</b> This command has no effect when the display module is not inverting the display image.</p>

CONFIDENTIAL

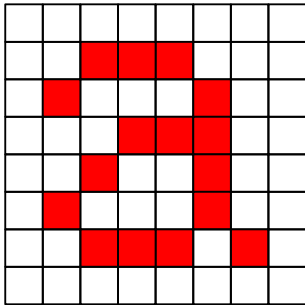

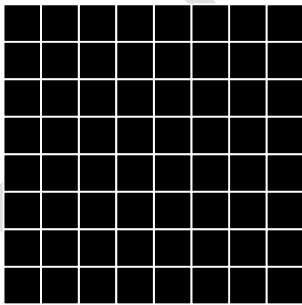

## INVON (2100H): Display Inversion On

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	2100h	No Argument								

Description	<p>This command causes the display module to invert the image data only on the display device. No status bits are changed.</p> <div style="display: flex; align-items: center; justify-content: center;"> <div style="text-align: center;"> <p><b>Input Image</b></p>  </div> <div style="margin: 0 20px; font-size: 2em;">→</div> <div style="text-align: center;"> <p><b>Display Panel</b></p>  </div> </div>
	<p><b>Restriction</b> This command has no effect when module is already in inversion on mode.</p>

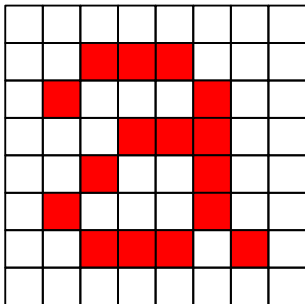

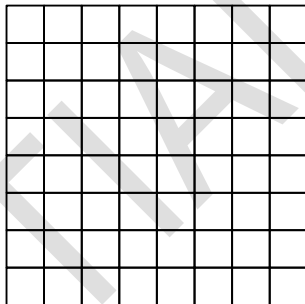

## ALLPOFF (2200H): All Pixel Off

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	2200h	No Argument								

Description	<p>This command turns the display panel black in Sleep Out mode and a status of the Display On/Off register can be on or off. This command does not change any other status.</p> <div style="display: flex; justify-content: space-around; align-items: center;"> <div style="text-align: center;"> <p><b>Input Image</b></p>  </div> <div style="font-size: 2em;">→</div> <div style="text-align: center;"> <p><b>Display Panel</b></p>  </div> </div> <p>“All Pixels On”, “Normal Display Mode On” or “Partial Mode On” commands are used to leave this mode. The display panel is showing the content of the Input Image after “Normal Display On” and “Partial Mode On” commands.</p>
Restriction	-

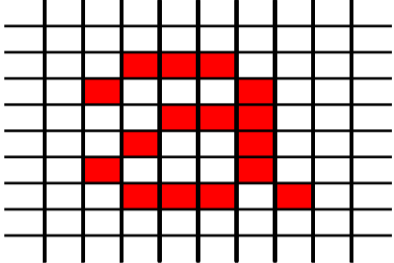

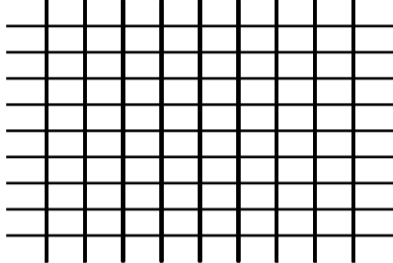

## ALLPON (2300H): All Pixel On

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	2300h	No Argument								

Description	<p>This command turns the display panel white in Sleep Out mode and a status of the Display On/Off register can be on or off. This command does not change any other status.</p> <div style="display: flex; justify-content: space-around; align-items: center;"> <div style="text-align: center;"> <p><b>Input Image</b></p>  </div> <div style="font-size: 2em;">→</div> <div style="text-align: center;"> <p><b>Display Panel</b></p>  </div> </div> <p>“All Pixels Off”, “Normal Display Mode On” or “Partial Mode On” commands are used to leave this mode. The display panel is showing the content of the Input Image after “Normal Display On” and “Partial Mode On” commands.</p>
	<p>Restriction -</p>

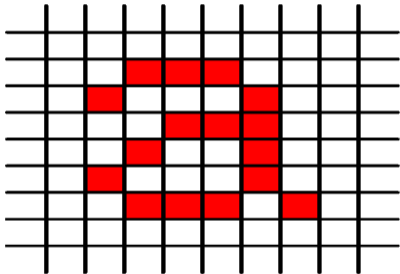

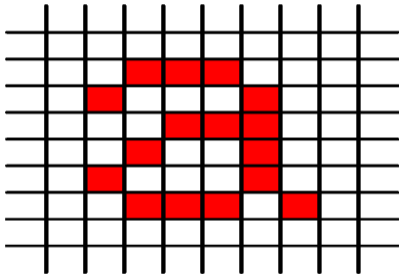

## DISPOFF (2800h): Display Off

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	2800h	No Argument								

Description	<p>This command causes the display module to stop displaying the image data on the display device. No status bits are changed.</p> <div style="display: flex; align-items: center; justify-content: center;"> <div style="text-align: center;"> <p><b>Input Image</b></p>  </div> <div style="margin: 0 20px; font-size: 2em;">→</div> <div style="text-align: center;"> <p><b>Display Panel</b></p>  </div> </div>
	<p><b>Restriction</b> This command has no effect when module is already in display off mode.</p>

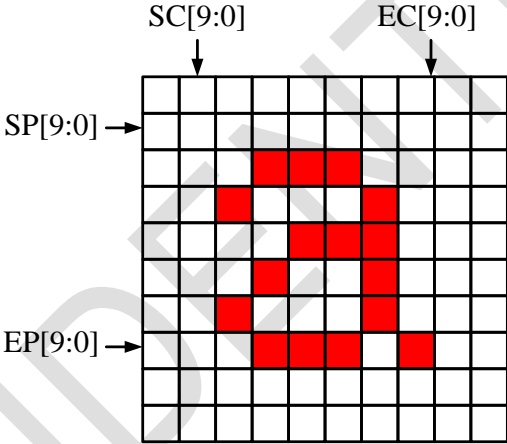

**DISPON (2900h): Display On**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	2900h	No Argument								

Description	<p>This command causes the display module to start displaying the image data on the display device. No status bits are changed.</p> <div><div><p><b>Input Image</b></p></div><div></div><div><p><b>Display Panel</b></p></div></div>
	<p><b>Restriction</b> This command has no effect when module is already in display on mode.</p>

**CASET(2A00h~2A03h) : Set Column Start Address**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	2A00h	-	-	-	-	-	-	SC9	SC8	00
	2A01h	SC7	SC6	SC5	SC4	SC3	SC2	SC1	SC0	00
	2A02h	-	-	-	-	-	-	EC9	EC8	01
	2A03h	EC7	EC6	EC5	EC4	EC3	EC2	EC1	EC0	8F

Description	<p>This command defines the column extent of the frame memory accessed by the host processor with the read_memory_continue and write_memory_continue commands. This command makes no change on the other driver status. The values of SC[9:0] and EC[9:0] are referred when RAMWR command comes. Each value represents one column line in the Frame Memory.</p> 
	<p>(1) SC[9:0] always must be equal to or less than EC[9:0].</p> <p>(2) The SC[9:0] and EC[9:0]-SC[9:0]+1 must can be divisible by 2.</p>

### **RASET(2B00h~2B03h) : Set Row Start Address**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	2B00h	-	-	-	-	-	-	SP9	SP8	00
	2B01h	SP7	SP6	SP5	SP4	SP3	SP2	SP1	SP0	00
	2B02h	-	-	-	-	-	-	EP9	EP8	01
	2B03h	EP7	EP6	EP5	EP4	EP3	EP2	EP1	EP0	8F

Description	<p>This command defines the page extent of the frame memory accessed by the host processor with the write_memory_continue and read_memory_continue command.</p> <p>This command makes no change on the other driver status. The values of SP[9:0] and EP[9:0] are referred when RAMWR command comes. Each value represents one Page line in the Frame Memory.</p> <div data-bbox="593 799 1160 1296"> </div>
Restriction	<p>(1) SP[9:0] always must be equal to or less than EP[9:0]</p> <p>(2) The SP[9:0] and EP[9:0]-SP[9:0]+1 must be divisible by 2.</p>

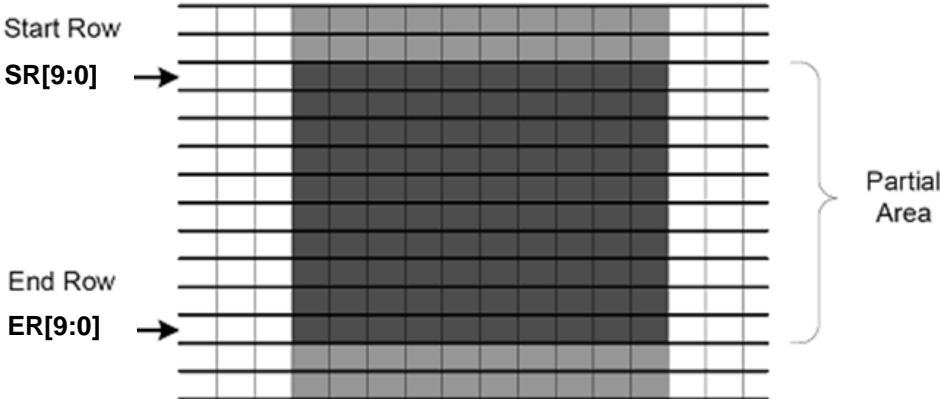

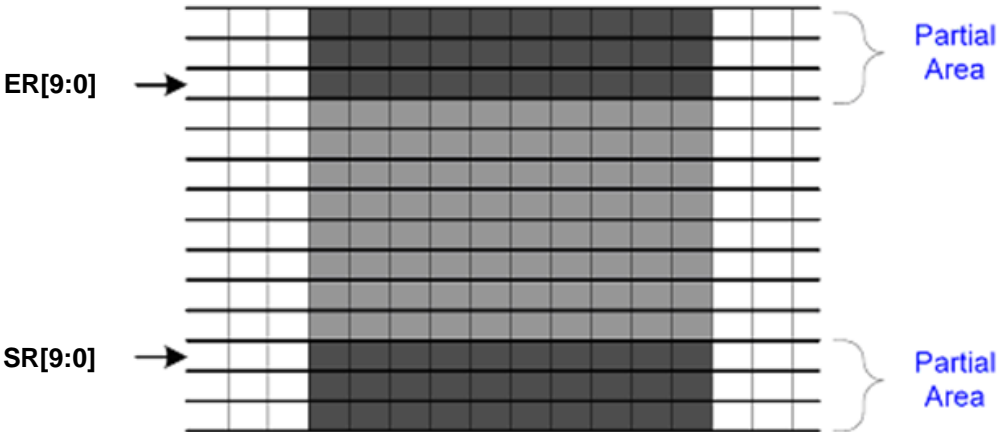

**RAMWR (2C00h): Memory Write**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	2C00h	0	0	1	0	1	1	0	0	2C
	1 <sup>st</sup> Pixel	D <sub>17</sub>	D <sub>16</sub>	D <sub>15</sub>	D <sub>14</sub>	D <sub>13</sub>	D <sub>12</sub>	D <sub>11</sub>	D <sub>10</sub>	
	:	:	:	:	:	:	:	:	:	
	N <sup>th</sup> Pixel	D <sub>N7</sub>	D <sub>N6</sub>	D <sub>N5</sub>	D <sub>N4</sub>	D <sub>N3</sub>	D <sub>N2</sub>	D <sub>N1</sub>	D <sub>N0</sub>	

Description	This command transfers image data from the host processor to the display module's frame memory starting at the pixel location specified by preceding CASET (2Ah) and RASET (2Bh) commands.
Restriction	A Memory Write should follow a CASET(2Ah), RASET(2Bh) or MADCTR(36h) to define the write location. Otherwise, data written with RAMWR(2Ch) and any following RAMWRC(3Ch) commands is written to undefined locations.

## PTLAR (3000h): Partial Area

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	3000h	-	-	-	-	-	-	SR9	SR8	00
	3001h	SR7	SR6	SR5	SR4	SR3	SR2	SR1	SR0	00
	3002h	-	-	-	-	-	-	ER9	ER8	01
	3003h	ER7	ER6	ER5	ER4	ER3	ER2	ER1	ER0	8F

Description	<p>This command defines the Partial Display mode's display area. There are two parameters associated with this command, the first defines the Start Row (SR) and the second the End Row (ER), as illustrated in the following figure.</p> <p>If End Row &gt; Start Row</p> 
	<p>If End Row &lt; Start Row</p> 
Restriction	<p>If End Row = Start Row then the Partial Area will be one row deep.</p> <p>SR[9:0] and ER[9:0] settings should be within max available Display Area.</p>

**PTLAR (3100h): Vertical Partial Area**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	3100h	-	-	-	-	-	-	-	SC8	00
	3101h	SC7	SC6	SC5	SC4	SC3	SC2	SC1	SC0	00
	3102h	-	-	-	-	-	-	-	EC8	01
	3103h	EC7	EC6	EC5	EC4	EC3	EC2	EC1	EC0	8F

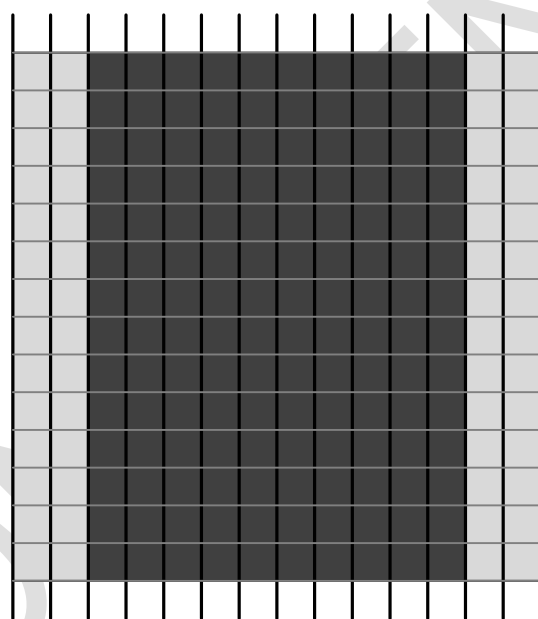

Description

This command defines the Vertical Partial Display mode's display area. There are two parameters associated with this command, the first defines the Start Column (SC) and the second the End Column (EC), as illustrated in the following figure.

If End Column > Start Column

Start Column  
SC[9:0]

End Column  
EC[9:0]

Partial Area

If End Column < Start Column

	<div data-bbox="379 230 1013 1064"> <p>End Column EC[9:0]</p> <p>Start Column SC[9:0]</p> <p>Partial Area</p> <p>Partial Area</p> <p>If End Column = Start Column then the Partial Area will be one column deep.</p> </div>
Restriction	SC[9:0] and EC[9:0] settings should be within max available Display Area.

**TEOFF (3400h): Tearing Effect Line OFF**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	3400h	No Argument								

Description	This command turns off the display module's Tearing Effect output signal on the TE signal line.
Restriction	This command has no effect when the Tearing Effect output is already off.

CONFIDENTIAL

**TEON (3500h): Tearing Effect Line ON**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	3500h	0	0	0	0	0	0	TE_M	TELOM	00

**MADCTR (3600h): Scan Direction Control**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	3600h	D7	D6	D5	D4	D3	D2	D1	D0	00

Description

This command defines the scan direction of Source and Gate Driver. This command makes no change on the other driver status.

Bit	Symbol	Description	Comment
D7	Reserved		
D6	MX	Column Address Increment	0: Increasing in horizontal 1: Decreasing in horizontal
D3	RGB	RGB/BGR Order	'1' =BGR, "0"=RGB
D2	Reserved		
D1	Reserved		
D0	Reserved		

Restriction

**IDMOFF (3800h): Idle Mode Off**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	3800h	No Argument								

Description	This command causes the display module to exit Idle mode.
Restriction	This command has no effect when the display module is not in Idle mode.

CONFIDENTIAL

**IDMON (3900h): Enter\_idle\_mode**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	3900h	No Argument								

Description	This command causes the display module to enter Idle Mode.
Restriction	This command has no effect when module is already in idle on mode.

## COLMOD (3A00h): Interface Pixel Format

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	3A00h	SPI_IFPF_SEL	VIPF[2]	VIPF[1]	VIPF[0]	0	IFPF[2]	IFPF[1]	IFPF[0]	77

This command sets the pixel format for the RGB image data used by the interface.  
The IFPF[2:0] pixel format used by the MIPI/ MCU interface.  
If SPI\_IFPF\_SEL(3Ah-D7) = 1: The VIPF[2:0] pixel format used by the SPI interface  
If SPI\_IFPF\_SEL(3Ah-D7) = 0: The IFPF[2:0] pixel format used by the SPI interface

Control Interface Color Format	IFPF[2]	IFPF[1]	IFPF[0]
SPI 8 bit/pixel (256 colors); SPI 256 Gray (Support IF: SPI3/SPI4)	0	0	1
SPI 8 bit/pixel (256 colors); SPI 3-3-2 (Support IF: SPI3/SPI4)	0	1	0
SPI 3 bit/pixel (8 colors); SPI 1-1-1 (Support IF: SPI3/SPI4)	0	1	1
16bit/pixel (65,536 colors)	1	0	1
18bit/pixel (262,144 colors)	1	1	0
24bit/pixel (16.7M colors)	1	1	1

SPI 1-1-1

Description

Restriction

**RAMWRC (3C00h): Memory Continuous Write**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	3C00h	0	0	1	1	1	1	0	0	3C
	1 <sup>st</sup> Pixel	D <sub>1</sub> 7	D <sub>1</sub> 6	D <sub>1</sub> 5	D <sub>1</sub> 4	D <sub>1</sub> 3	D <sub>1</sub> 2	D <sub>1</sub> 1	D <sub>1</sub> 0	
	:	:	:	:	:	:	:	:	:	
	N <sup>th</sup> Pixel	D <sub>N</sub> 7	D <sub>N</sub> 6	D <sub>N</sub> 5	D <sub>N</sub> 4	D <sub>N</sub> 3	D <sub>N</sub> 2	D <sub>N</sub> 1	D <sub>N</sub> 0	

Description	This command transfers image data from the host processor to the display module's frame memory continuing from the pixel location following the previous write_memory_continue or write_memory_start command.
Restriction	A Memory Write should follow a CASET(2Ah), RASET(2Bh) or MADCTR(36h) to define the write location. Otherwise, data written with RAMWR(2Ch) and any following RAMWRC(3Ch) commands is written to undefined locations.

**STESL(4400h) : Set\_Tear\_Scanline**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	4400h	STS[15]	STS[14]	STS[13]	STS[12]	STS[11]	STS[10]	STS[9]	STS[8]	00
	4401h	STS[7]	STS[6]	STS[5]	STS[4]	STS[3]	STS[2]	STS[1]	STS[0]	00

Description	<p>This command turns on the display Tearing Effect output signal on the TE signal line when the display reaches line N. The TE signal is not affected by changing set_address_mode bit B4. The Tearing Effect Line On has one parameter that describes the Tearing Effect Output Line mode.</p>  <p>The Tearing Effect Output line shall be active low when the display module is in Sleep mode.</p>
	Restriction

**GSL (4500h) : Get\_Scanline**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
R	4500h	GTS[15]	GTS[14]	GTS[13]	GTS[12]	GTS[11]	GTS[10]	GTS[9]	GTS[8]	0x
	4501h	GTS[7]	GTS[6]	GTS[5]	GTS[4]	GTS[3]	GTS[2]	GTS[1]	GTS[0]	xx

Description	The display returns the current scan line, N, used to update the display device. The total number of scan lines on a display device is defined as VSYNC + VBP + VACT + VFP. The first scan line is defined as the first line of V-Sync and is denoted as Line 0. When in Sleep Mode, the value returned by get scanline is undefined.
Restriction	-

**DSTBON (4F00h): Deep Standby Mode On**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	4F00h	0	0	0	0	0	0	0	DSTB	00

Description	<p>This command is used to enter deep standby mode. DSTB="1", enter deep standby mode.</p> <p>Notes:</p> <ol style="list-style-type: none"><li>1. To exit Deep Standby Mode, input low pulse more than 3 msec to pin RESX.</li><li>2. For MIPI IF, if deep standby mode is used, please pull HSSI_CLK_P/N &amp; HSSI_D0~D1_P/N to GND after executing deep standby command.</li></ol>
Restriction	-

**WRDISBV (5100h): Write Display Brightness**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	5100h	DBV7	DBV6	DBV5	DBV4	DBV3	DBV2	DBV1	DBV0	00

Description	This command is used to adjust brightness value. In principle relationship is that 00h value means the lowest brightness and FFh value means the highest brightness.
Restriction	The display supplier cannot use this command for tuning

## RDDISBV (5200h): Read Display Brightness

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
R	5200h	DBV7	DBV6	DBV5	DBV4	DBV3	DBV2	DBV1	DBV0	00

Description	This command returns brightness value. In principle relationship is that 00h value means the lowest brightness and FFh value means the highest brightness.
Restriction	-

CONFIDENTIAL

## WRCTRLD (5300h): Write Display Control

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	5300h	0	0	BCTRL	0	DD	0	0	0	28

Description	BCTRL: Brightness control ,1=enable DD: Display dimming control ,1=enable
Restriction	The display supplier cannot use this command for tuning

CONFIDENTIAL

**RDCTRLD (5400h): Read Display Control**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
R	5400h	0	0	BCTRL	0	DD	0	0	0	28

Description	BCTRL: Brightness control ,1=enable DD: Display dimming control ,1=enable
Restriction	-

**WRRADACL (5500h): RAD\_ACL Control**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	5500h	0	0	0	0	0	0	RAD_ACL[1:0]		00

Description	This command is used to control Raydium specific function for ACL (Auto Current Limit) RAD_ACL[1:0]=11, Enable Raydium ACL function. RAD_ACL[1:0]=00, Disable Raydium ACL function.
Restriction	-

**IMGEHCCTR (5800h) : Set\_color\_enhance**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	5800h	0	0	0	0	0	SLR_EN	SLR_LEVEL 1	SLR_LEVEL 0	00

Description	Bit	Description	Value
	SLR_EN	Sunlight Readable Enhancement Enable	'0' : disable; '1': enable
	SLR_LEVEL[1:0]	Sunlight Readable Enhancement Level	0~2, low to high
Restriction	-		

**IMGEHCCTR (5900h) : Read\_color\_enhance**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
R	5900h	0	0	0	0	0	SLR_EN	SLR_LEVEL1	SLR_LEVEL0	00

Description	Bit	Description	Value
	SLR_EN	Sunlight Readable Enhancement Enable	'0' : disable; '1': enable
	SLR_LEVEL[1:0]	Sunlight Readable Enhancement Level	0~2, low to high
Restriction	-		

**WRDISBV (6300h): Write HBM Display Brightness**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	6300h	DBV_HBM[7:0]								00

Description	This command is used to adjust brightness value in HBM mode if hbm_gidx_type=1.(0xC840h)
Restriction	1. The display supplier cannot use this command for tuning 2. DBV_HBM[7:0] setting value must be greater than G_ratio_to2 (0xAC60h )/ G_ratio_to3 (0x5530h ) value.

**RDDISBV (6400h): Read HBM Display Brightness**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
R	6400h	DBV_HBM[7:0]								00

Description	This command returns brightness value in HBM mode.
Restriction	-

**HBM\_Mode (6600h) : Set\_HBM\_Mode**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	6600h	0	0	0	0	0	0	HBM_en	0	00

Description	HBM_en = 1, This command causes the display module to enter HBM mode (exit normal, idle and deep idle)  HBM_en = 0, This command causes the display module to exit HBM mode (to normal mode)
Restriction	under display area

**Deep\_Idle\_Mode (6700h) : Set\_Deep Idle Mode**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	6700h	0	0	0	0	0	0	0	DEEP_IDLE_EN	00

Description	Deep_Idle_en = 1, This command causes the display module to enter deep idle mode (exit normal, idle and HBM)  Deep_Idle_en = 0, This command causes the display module to exit deep idle mode (to idle mode)
Restriction	under display area

**COLSET (7000~7F00h): Interface Pixel Format Set**

P1[2:0] = 3'b101 = { R\_0101[7:0], G\_0101[7:0], B\_0101[7:0] }      CMD 7500h-7502h

## RDDDBS(A100h) : Read\_DDB\_Start

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
R	A100h	SID[7]	SID [6]	SID [5]	SID [4]	SID [3]	SID [2]	SID [1]	SID [0]	D0
	A101h	SID[15]	SID[14]	SID[13]	SID[12]	SID[11]	SID[10]	SID[9]	SID[8]	01
	A102h	MID[7]	MID[6]	MID[5]	MID[4]	MID[3]	MID[2]	MID[1]	MID[0]	80
	A103h	MID[15]	MID[14]	MID[13]	MID[12]	MID[11]	MID[10]	MID[9]	MID[8]	90
	A104h	1	1	1	1	1	1	1	1	FF

Description	<p>1<sup>st</sup> parameter: Supplier ID code</p> <p>2<sup>nd</sup> parameter: Supplier ID code</p> <p>3<sup>rd</sup> parameter: Module ID</p> <p>4<sup>th</sup> parameter: Module ID</p> <p>5<sup>th</sup> Exit code (FFh).</p>
Restriction	

**RDDDBC(A800h) : Read DDB Continous**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
R	A800h	SID[7]	SID [6]	SID [5]	SID [4]	SID [3]	SID [2]	SID [1]	SID [0]	D0
	A801h	SID[15]	SID[14]	SID[13]	SID[12]	SID[11]	SID[10]	SID[9]	SID[8]	01
	A802h	MID[7]	MID[6]	MID[5]	MID[4]	MID[3]	MID[2]	MID[1]	MID[0]	80
	A803h	MID[15]	MID[14]	MID[13]	MID[12]	MID[11]	MID[10]	MID[9]	MID[8]	90
	A804h	1	1	1	1	1	1	1	1	FF

Description	<p>This command returns the supplier identification and display module mode/revision information from the point where RDDDBS command was interrupted by an other command.</p> <p><i>Note: Parameter 0xFF is an "Exit Code", this means that there is no more data in the DDB block.</i></p> <p><i>Note: For use example,</i></p> <ol style="list-style-type: none"> <li>1. Set maximum return packet size=3</li> <li>2. Read 0xA1, return 3 bytes SID[7:0], SID[15:8], MID[7:0]</li> <li>3. Read 0xA8, return 2 bytes MID[15:8], and 0xFF</li> </ol>
Restriction	<p>A Read DDB Start command (RDDDBS) should be executed at least once before a Read DDB Continue command (RDDDBC) to define the read location. Otherwise, data read with a Read DDB Continue command is undefined.</p>

**RDFCS(AA00h) : Read First Checksum**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
R	AA00h	FCS7	FCS6	FCS5	FCS4	FCS3	FCS2	FCS1	FCS0	00

Description	This command returns the first checksum what has been calculated from “User Command Set” area registers (not include “Manufacture Command Set) and the frame memory after the write access to those registers and/or frame memory has been done.
Restriction	It will be necessary to wait 150ms after there is the last write access on “User Command Set” area registers before there can read this checksum value.

## RDCCS(AF00h) : Read Continue Checksum

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
R	AF00h	CCS7	CCS6	CCS5	CCS4	CCS3	CCS2	CCS1	CCS0	00

Description	This command returns the continue checksum what has been calculated continuously after the first checksum has calculated from “User Command Set” area registers and the frame memory after the write access to those registers and/or frame memory has been done.
Restriction	It will be necessary to wait 300ms after there is the last write access on “User Command Set” area registers before there can read this checksum value in the first time.

**SetDISPMode (C200h) : set\_DISP Mode**

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	C200h	0	0	0	0	0	0	DM1	DM0	00

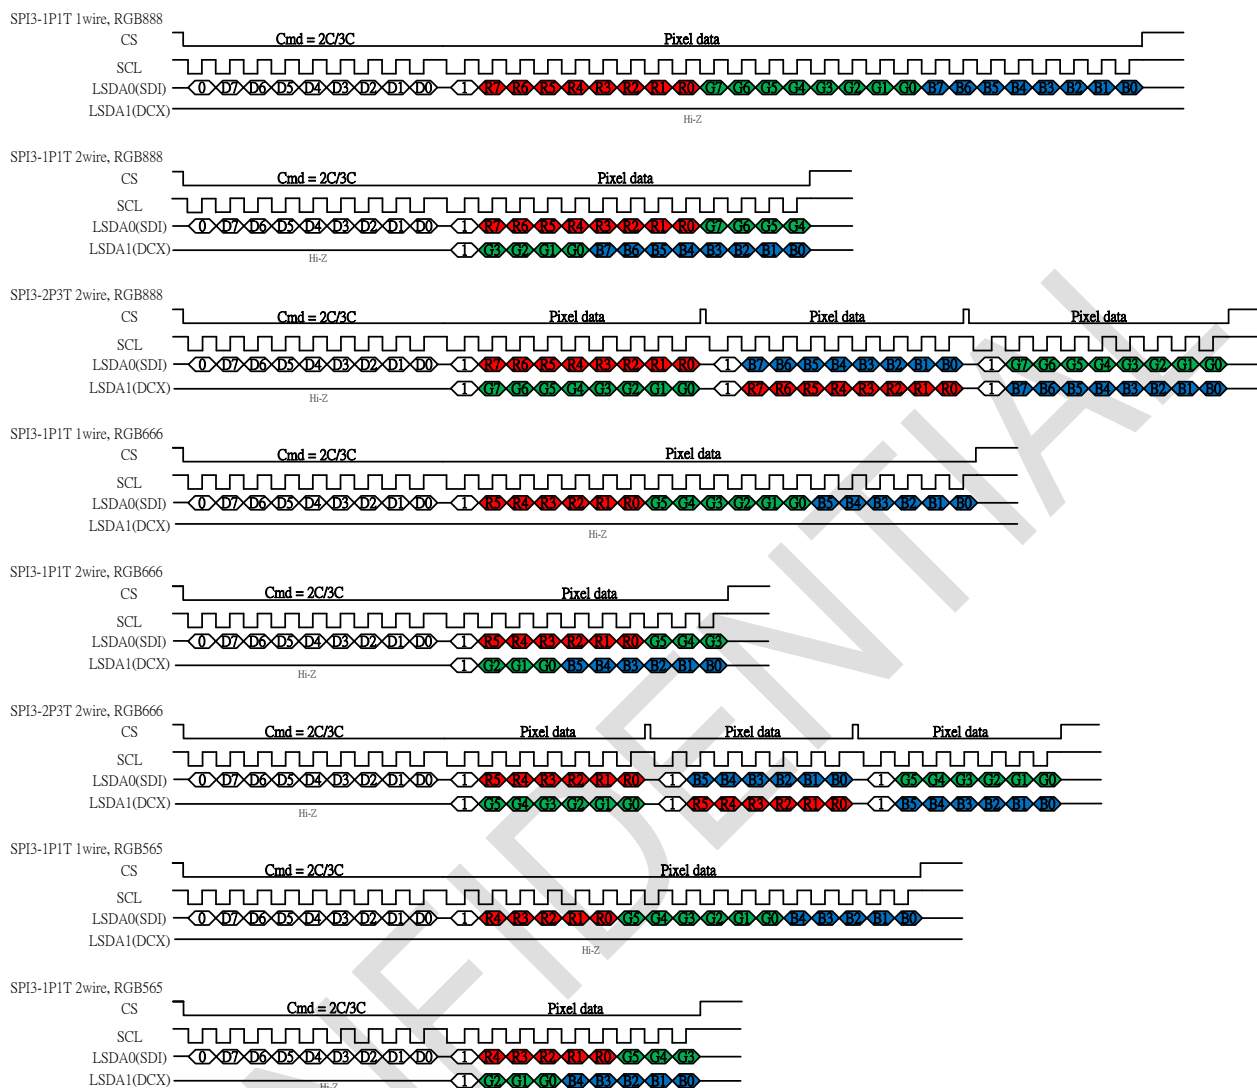

Description	Bit	Description	Value
	DM[1:0]	Display timing mode selection	2'b00: internal timing 2'b01: reserved 2'b10: reserved 2'b11: external timing (VSYNC + HSYNC align mode)
Restriction	Note: (1) If video mode, need to set DM[1:0] = 2'b11. (2) System video mode parameter V-total and H-total setting has restriction, it must match driver IC V-total and H-total setting. Related video mode parameter settings suggest asking Raydium.		

**SetDSPIMode (C400h) : set\_DSPI Mode**

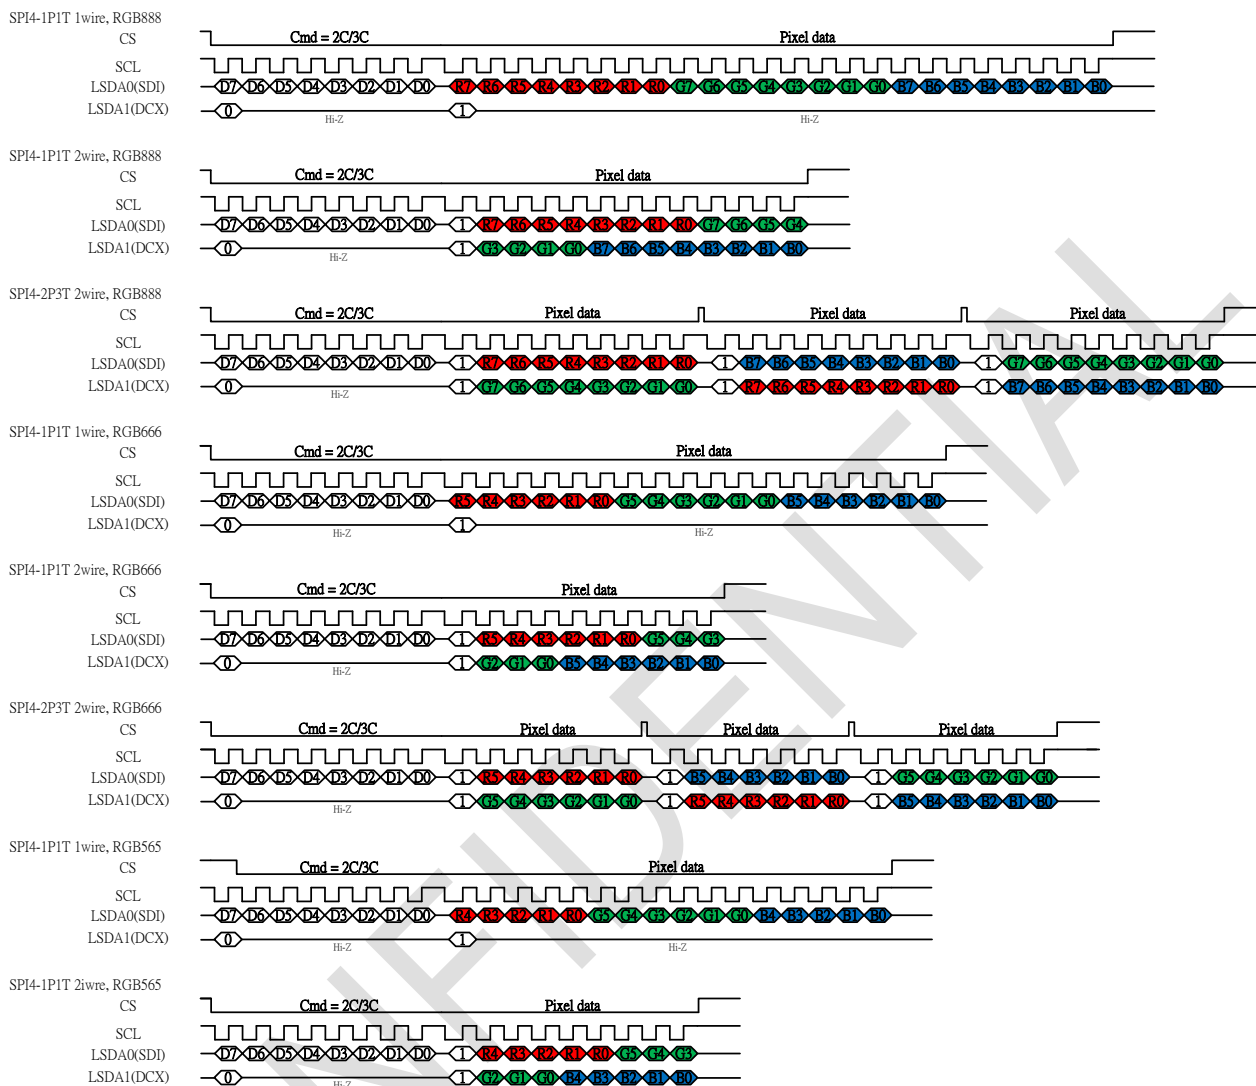

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX
W	C400h	SPI_WRAM	0	DSPI_CFG 1	DSPI_CFG 0	0	0	0	DSPI_EN	00

Description	Bit	Description	Value
	DSPI_EN	DAUL SPI MODE Enable	0: disable 1: enable
	DSPI_CFG[1:0]	DAUL SPI MODE Selection	00: 1P1T for 1 wire 10: 1P1T for 2 wire 11: 2P3T for 2 wire 01: reserved
	SPI_WRAM	This command is used in SPI/SPINK interfaces. Making sure to set SPI_WRAM=1 before host writes SRAM via SPI/SPINK interfaces.	0: disable 1: SPI interface write RAM enable
Note: detailed DAUL SPI formats are described at next page.			
Restriction			

## DUAL SPI via SPI3 interface :

## DUAL SPI via SPI4 interface :

## RDID1 (DA00h): ID1 Code

R/W	Address	D7	D6	D5	D4	D3	D2	D1	D0	HEX

Restriction	-		

## 7. Electrical Characteristics

### 7.1 Absolute Maximum Ratings

The absolute maximum rating is listed on following table. When RM69092 is used out of the absolute maximum ratings, the RM69092 may be permanently damaged. To use the RM69092 within the following electrical characteristics limit is strongly recommended for normal operation. If these electrical characteristic conditions are exceeded during normal operation, the RM69092 will malfunction and cause poor reliability.

Item	Symbol	Value	Unit
Power supply voltage	VDDI	-0.3 ~ + 5.5	V
Power supply voltage	VDD (VDDA, VDDb, VDDR)	-0.3 ~ + 5.5	V
Supply voltage (MV)	AVDD- AVSS	-0.3 ~ + 6.6	V
	AVSS- VCL	-0.3 ~ + 5.0	V
Supply voltage (HV)	VGH- VGLX	-0.3 ~ + 33	V
Input voltage	VIN	-0.3 ~ VDDI+ 0.3	V
Output voltage	VO	-0.3 ~ VDDI+ 0.3	V
Operating temperature	Topr	-40 ~ + 85	°C
Storage temperature	Tstg	-55 ~ + 125	°C
Notes: If one of the above items is exceeded its maximum limitation momentarily, the quality of the product may be degraded. Absolute maximum limitation. Therefore, specify the values exceeding which the product may be physically damaged. Be sure to use the product within the recommend range.			

### 7.2 ESD Protection Level

Model	Test Condition	Level
Human Body Mode	R = 1.5 kohm / C = 100 pF	Pass 3KV
Machine Mode	R = 0 ohm / C = 200 pF	Pass 300V

### 7.3 Latch-Up Protection Level

The device will not latch up at trigger current levels less than  $\pm 200$  mA.

## 7.4 DC Characteristics

### 7.4.1 Basic Characteristics

Parameter	Symbol	Condition	Min.	Typ.	Max.	Unit	Related Pins
Analog Power Supply Voltage	VDD	Operation Voltage	2.7	2.8	3.6	V	Note 1
I/O pin Power Supply Voltage	VDDI	I/O supply voltage	1.65	1.8	3.3	V	Note 1,2
Logic High level input voltage	VIH	VDDI = 1.65V ~ 3.3V	0.8* VDDI	-	VDDI	V	Note 3
Logic Low level input voltage	VIL	VDDI = 1.65V ~ 3.3V	0.0	-	0.2* VDDI	V	Note 3
Logic High level Output voltage	VOH	Iout = -1 mA	0.8* VDDI	-	VDDI	V	Note 3
Logic Low level Output voltage	VOL	Iout = +1 mA	0.0	-	0.2* VDDI	V	Note 3
Logic High level input current (Except MIPI)	IIHD	Vin=0~VDDI			1	uA	Note 3
Logic Low level input current (Except MIPI)	IILD	Vin=0~VDDI	-1			uA	Note 3
Logic High level input current (MIPI)	IIHD	Vin=0~VDDI			1	uA	Note 3
Logic Low level input current (MIPI)	IILD	Vin=0~VDDI	-1			uA	Note 3
AVDD booster voltage	AVDD		4.5		6.5	V	Note 3
VCL booster voltage	VCL		-3.5		-5	V	Note 3
VGH booster voltage	VGH		AVDD		2AVDD	V	Note 3
VGL booster voltage	VGL		VCL		VCL -AVDD	V	Note 3
Voltage difference between VGH and VGL	VGHL	VGH-VGL			30	V	Note 3
Gamma reference voltage	VGMP		2.0		6.3	V	Note 3,4
Gamma reference voltage	VGSP		0.0		4.5	V	Note 3
OSC	Fosc		21.16	23	24.84	MHz	
Channel deviation voltage	VDEV	Sout ≥ AVDD-1.0V, and 0V < Sout ≤ 1.0V				mV	TBD
Channel deviation voltage	VDEV	1.0V < Sout < AVDD-1.0V				mV	TBD

Notes:

1. VDD means VDDA, VDDR, VDDB. And VSS means VSSA, VSSR, VSSB, AVSS, VSSAM. VDDB, VDDA and VDDR should be the same input voltage level and larger than VDDI voltage.
2. Recommend VDDI=1.8V for power saving.
3. Ta(ambient temperature) ranges from -30℃ to 85℃.
4. VGMP ≤ AVDD - 0.2V

## 7.4.2 Operation current

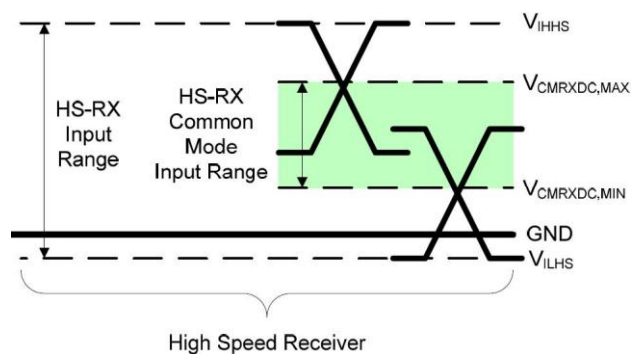

VCI=2.8V and VDDI=1.8V

Parameter	Symbol	Condition	Max.	Unit
Sleep In Mode	I_SLP_VCI	VDDI=VCC=1.8V VCI=VDDA=VDDDB=VDDR=2.8V	50	uA
	I_SLP_VDDI	HSSI_D0P/N=HSSI_D1P/N=HSSI_CKP/N=LP-11 Ta = 25deg	180	uA
Deep Standby Mode	I_DSTB_VCI	VDDI=VCC=1.8V VCI=VDDA=VDDDB=VDDR=2.8V	4	uA
	I_DSTB_VDDI	HSSI_D0P/N=HSSI_D1P/N=HSSI_CKP/N=0 Ta = 25deg	1	uA

## 7.5 MIPI Characteristics

### 7.5.1 High-Speed Receiver Specification

#### DC Specifications

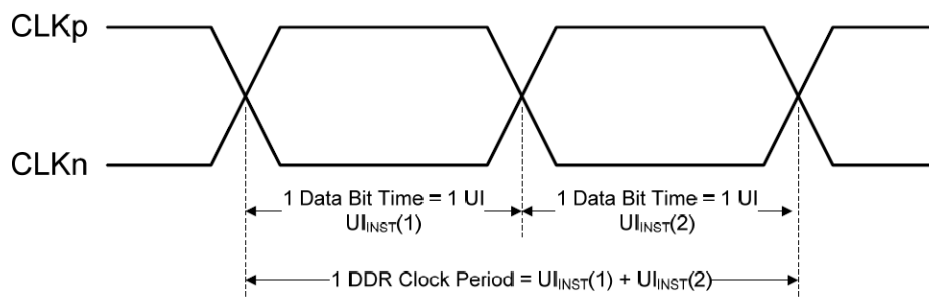

Parameter	Description	Min	Nom	Max	Units	Note
VCMRX(DC)	Common-mode voltage HS receive mode	70		330	mV	1,2
VIDTH	Differential input high threshold			70	mV	
VIDTL	Differential input low threshold	-70			mV	
VIHHS	Single-ended input high voltage			460	mV	1
VILHS	Single-ended input low voltage	-40			mV	1
ZID	Differential input impedance	80	100	125	$\Omega$	

#### Notes:

1. Excluding possible additional RF interference of 100mV peak sine wave beyond 450MHz.
2. This table value includes a ground difference of 50mV between the transmitter and the receiver, the static common-mode level tolerance and variations below 450MHz

## 7.5.2 Forward high speed transmissions

## DDR Clock Definition

Clock Parameter	Symbol	Min	Typ	Max	Units	Notes
UI instantaneous	$UI_{INST}$	2		12.5	ns	1,2

## Notes:

1. This value corresponds to a minimum 80 Mbps data rate.
2. The minimum UI shall not be violated for any single bit period, i.e., any DDR half cycle within a data burst.

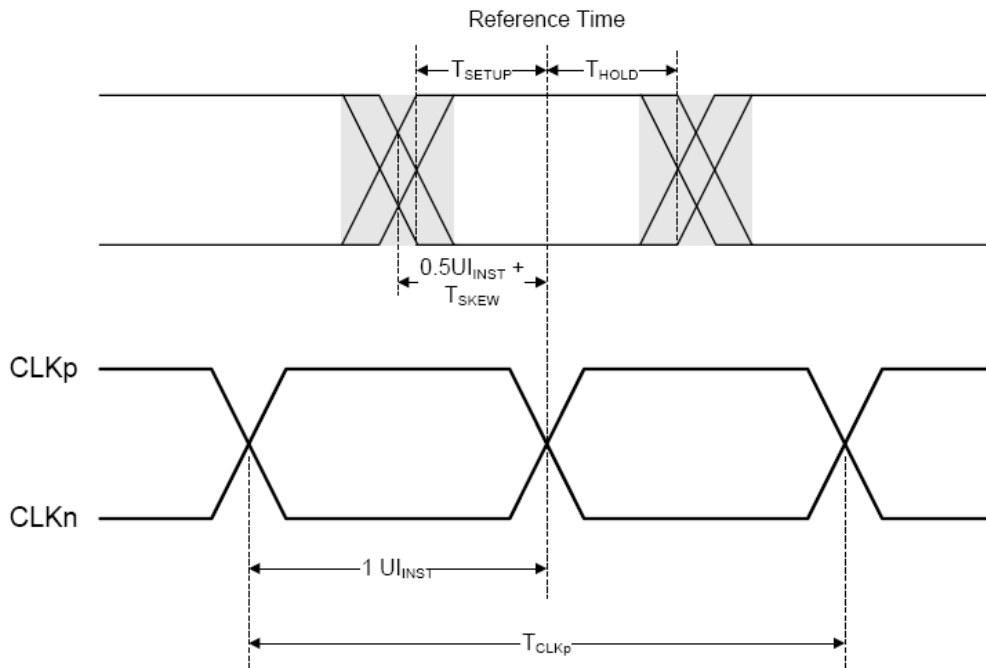

## Data-Clock Timing Specifications

Parameter	Symbol	Min	Typ	Max	Units	Notes
Data to Clock Skew [measured at transmitter]	$T_{SKEW[TX]}$	-0.15		0.15	$UI_{INST}$	1
Data to Clock Setup Time [receiver]	$T_{SETUP[RX]}$	0.15			$UI_{INST}$	2
Clock to Data Hold Time [receiver]	$T_{HOLD[RX]}$	0.15			$UI_{INST}$	2

## Notes:

1. Total silicon and package delay budget of  $0.3 \cdot UI_{INST}$
2. Total setup and hold window for receiver of  $0.3 \cdot UI_{INST}$

### 7.5.3 Data to Clock Timing Definitions

## 7.5.4 Low power transceiver specifications

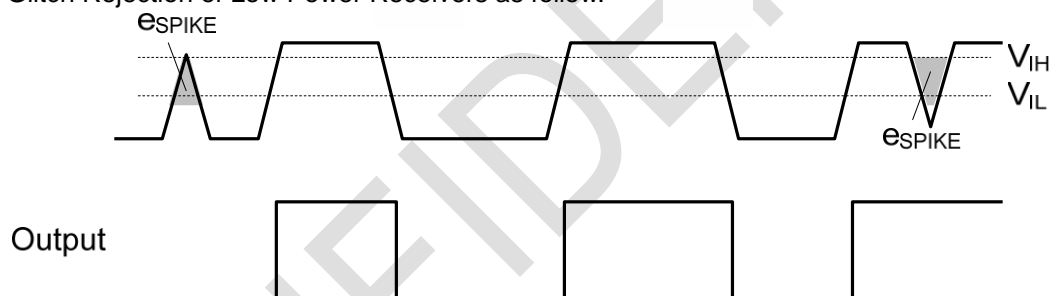

Parameters	Symbol	Condition	Min	Typ	Max	Unit
Logic high level input voltage	VIHCD	Contention Detection (Lane_D0)	450		1350	mV
Logic low level input voltage	VILCD	Contention Detection (Lane_D0)	0		200	mV
Logic high level input voltage	VIH-LPRX	LP-Rx (Lane_CK, Lane_D0, Lane_D1)	880	-	1350	mV
Logic low level input voltage	VIL-LPRX	LP-Rx (Lane_CK, Lane_D0, Lane_D1)	0		550	mV
Logic low level input voltage	VIL-ULPS	LP-Rx ULPS (Lane_CK, Lane_D0, Lane_D1)	0		300	mV
Logic high level input voltage	VOH-LPTX	Contention Detection (Lane_D0)	1.1	1.2	1.3	V
Logic low level input voltage	VOL-LPTX	Contention Detection (Lane_D0)	-50	0	50	mV
eSPIKE <sup>(1,2,3)</sup>	Fig. 2	Input pulse rejection			300	V.ps

Notes:

Time-voltage integration of a spike above VIL when being in LP-0 state or below VIH when being in LP-1 State. An impulse less than this will not change the receiver state.

In addition to the required glitch rejection, implementers shall ensure rejection of known RF-interferers.

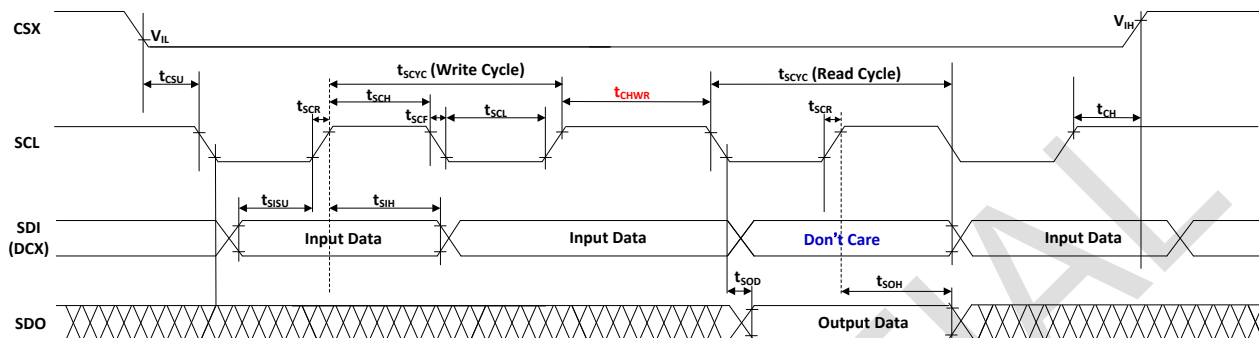

Input Glitch Rejection of Low Power Receivers as follow.

## 7.6 AC Characteristics

### 7.6.1 Serial Interface Characteristics

#### SPI Serial Interface Characteristics

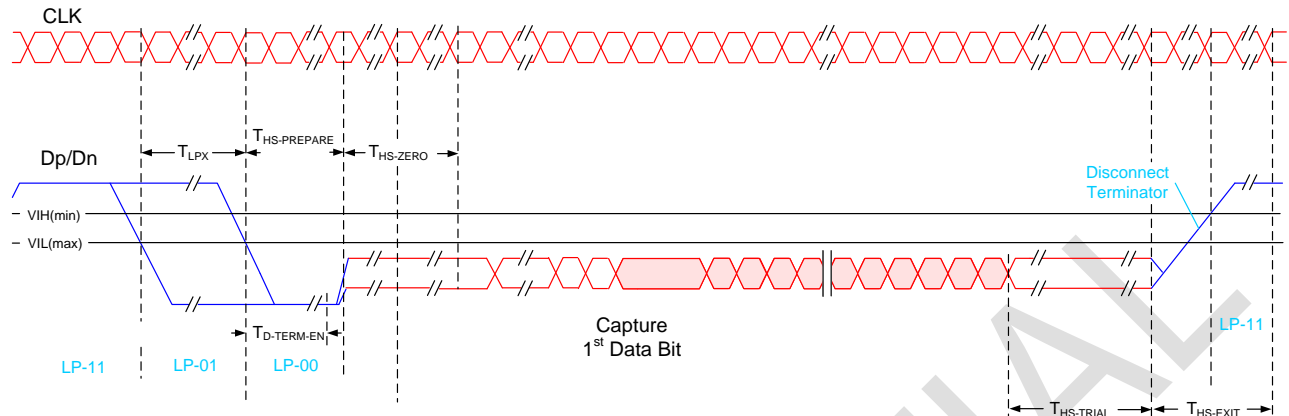

Parameter	Symbol	Condition	Min.	Typ.	Max.	Unit
Clock cycle	$t_{SCYC}$	Write	20			ns
		Read	300			ns
Clock high pulse width	$t_{SCH}$	Write	9			ns
		Read	140			ns
Clock low pulse width	$t_{SCL}$	Write	9			ns
		Read	140			ns
Clock rise time	$t_{SCR}$	$0.2 \cdot V_{DDI} \rightarrow 0.8 \cdot V_{DDI}$			2	ns
Clock fall time	$t_{SCF}$	$0.8 \cdot V_{DDI} \rightarrow 0.2 \cdot V_{DDI}$			2	ns
Chip select setup time	$t_{CSU}$		10			ns
Chip select hold time	$t_{CH}$		10			ns
Data input setup time	$t_{SISU}$	To $V_{IL}$ of SCL's rising edge	5			ns
Data input hold time	$t_{SIH}$		5			ns
Access time of output data	$t_{SOD}$	From $V_{IL}$ of SCL's falling edge			120	ns
Hold time of output data	$t_{SOH}$	From $V_{IH}$ of SCL's rising edge	5			ns
Transition time from Write cycle to Read cycle	$t_{CHWR}$	From $V_{IH}$ of SCL's rising edge	150			ns

#### Notes:

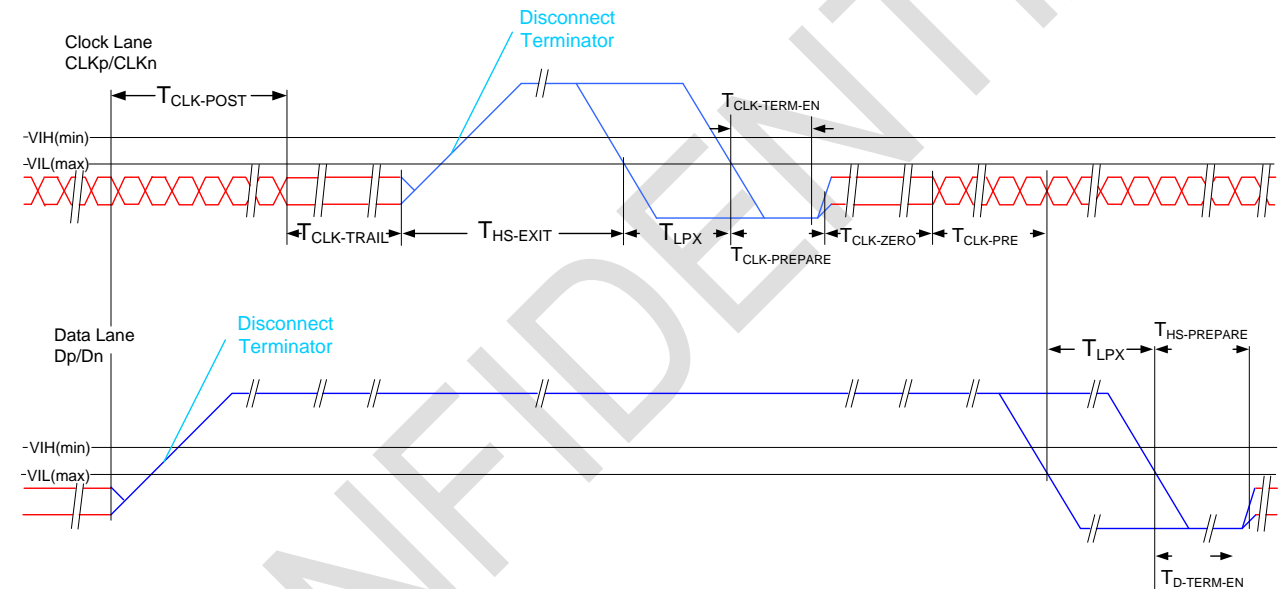

- (1) Logic high and low levels are specified as 80% and 20% of  $V_{DDI}$  for Input signals.
- (2) For the 4-wire SPI, the DCX's timing is the same as input data.
- (3)  $T_a = -30^\circ\text{C}$  to  $70^\circ\text{C}$ ,  $V_{DDI}=1.65\text{V}$  to  $3.3\text{V}$ ,  $V_{DD}=2.7\text{V}$  to  $3.6\text{V}$ , and  $V_{SS}=0\text{V}$

## 7.6.2 DSI Timing Characteristics

### HS Data Transmission Burst

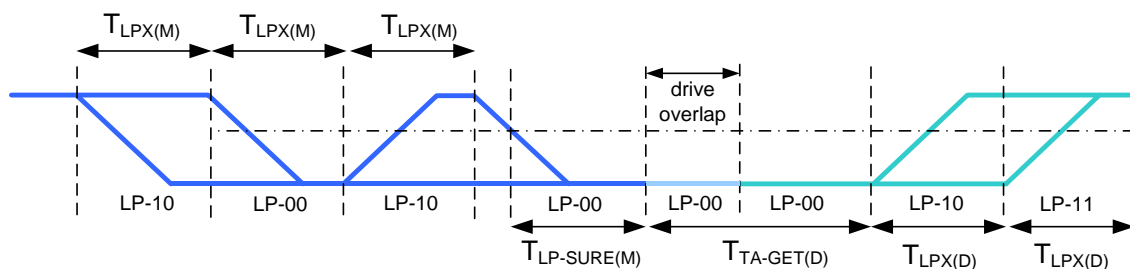

### HS clock transmission

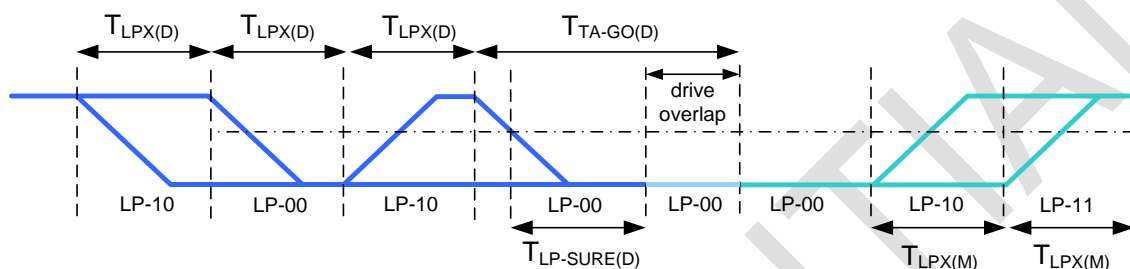

## Timing Parameters:

Parameter	Description	Min	Typ	Max	Unit
$T_{CLK-POST}$	Time that the transmitter continues to send HS clock after the last associated Data Lane has transitioned to LP Mode. Interval is defined as the period from the end of $T_{HS-TRAIL}$ to the beginning of $T_{CLK-TRAIL}$ .	$60ns + 52*UI$			ns
$T_{CLK-TRAIL}$	Time that the transmitter drives the HS-0 state after the last payload clock bit of a HS transmission burst.	60			ns
$T_{HS-EXIT}$	Time that the transmitter drives LP-11 following a HS burst.	300			ns
$T_{CLK-TERM-EN}$	Time for the Clock Lane receiver to enable the HS line termination, starting from the time point when Dn crosses $V_{IL,MAX}$ .	Time for Dn to reach $V_{TERM-EN}$		38	ns
$T_{CLK-PREPARE}$	Time that the transmitter drives the Clock Lane LP-00 Line state immediately before the HS-0 Line state starting the HS transmission.	38		95	ns
$T_{CLK-PRE}$	Time that the HS clock shall be driven by the transmitter prior to any associated Data Lane beginning the transition from LP to HS mode.	8			UI
$T_{CLK-PREPARE} + T_{CLK-ZERO}$	$T_{CLK-PREPARE}$ + time that the transmitter drives the HS-0 state prior to starting the Clock.	300			ns
$T_{D-TERM-EN}$	Time for the Data Lane receiver to enable the HS line termination, starting from the time point when Dn crosses $V_{IL,MAX}$ .	Time for Dn to reach $V_{TERM-EN}$		$35 ns + 4*UI$	
$T_{HS-PREPARE}$	Time that the transmitter drives the Data Lane LP-00 Line state immediately before the HS-0 Line state starting the HS transmission	$40ns + 4*UI$		$85 ns + 6*UI$	ns
$T_{HS-PREPARE} + T_{HS-ZERO}$	<b><math>T_{HS-PREPARE}</math> + time that the transmitter drives the HS-0 state prior to transmitting the Sync sequence.</b>	<b><math>145ns + 10*UI</math></b>			<b>ns</b>
$T_{HS-TRAIL}$	Time that the transmitter drives the flipped differential state after last payload data bit of a HS transmission burst	$60ns + 4*UI$			ns

## Turnaround Procedure

## Bus turnaround (BAT) from MPU to display module timing

## Bus turnaround (BAT) from display module to MPU timing

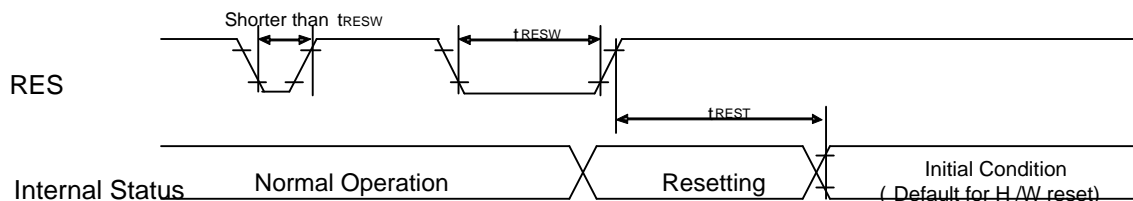

### Low Power Mode :

Parameter	Description	Min	Typ	Max	Unit	Notes
$T_{LPX(M)}$	Transmitted length of any Low-Power state period of MCU to display module	50		<b>150</b>	ns	1,2
$T_{TA-SURE(M)}$	Time that the display module waits after the LP-10 state before transmitting the Bridge state (LP-00) during a Link Turnaround.	$T_{LPX(M)}$		$2 * T_{LPX(M)}$	ns	2
$T_{LPX(D)}$	Transmitted length of any Low-Power state period of display module to MCU	50		<b>150</b>	ns	1,2
$T_{TA-GET(D)}$	Time that the display module drives the Bridge state (LP-00) after accepting control during a Link Turnaround.		$5 * T_{LPX(D)}$		ns	2
$T_{TA-GO(D)}$	Time that the display module drives the Bridge state (LP-00) before releasing control during a Link Turnaround.		$4 * T_{LPX(D)}$		ns	2
$T_{TA-SURE(D)}$	Time that the MPU waits after the LP-10 state before transmitting the Bridge state (LP-00) during a Link Turnaround.	$T_{LPX(D)}$		$2 * T_{LPX(D)}$	ns	2

### NOTE:

- $T_{LPX}$  is an internal state machine timing reference. Externally measured values may differ slightly from the specified values due to asymmetrical rise and fall times.
- Transmitter-specific parameter

## 7.6.3 Reset Timing

Reset input timing:

VDDI=1.65 to 3.3V, VDD=2.7 to 3.6V, AGND=DGND=0V, Ta=-40 to 85°C

Symbol	Parameter	Related Pins	MIN	TYP	MAX	Note	Unit
t <sub>RESW</sub>	*1) Reset low pulse width	RESX	10	-	-	-	μs
t <sub>REST</sub>	*2) Reset complete time	-	-	-	10	When reset applied during Sleep in mode	ms
		-	-	-	120	When reset applied during Sleep out mode	ms

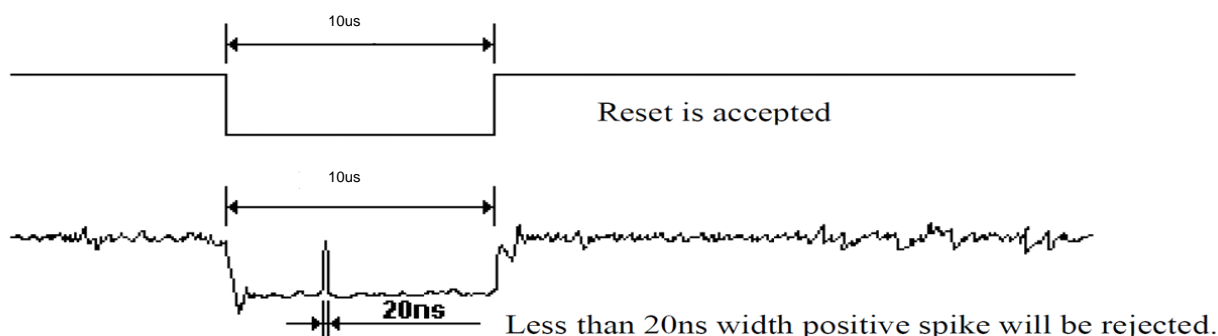

Note 1) Spike due to an electrostatic discharge on RESX line does not cause irregular system reset according to the table below.

RESX Pulse	Action
Shorter than 5μs	Reset Rejected
Longer than 10μs	Reset
Between 5μs and 10μs	Reset starts (It depends on voltage and temperature condition.)

Note 2. During the resetting period, the display will be blanked (The display is entering blanking sequence, which maximum time is 120 ms, when Reset Starts in Sleep Out –mode. The display remains the blank state in Sleep In –mode) and then return to Default condition for H/W reset.

Note 3. During Reset Complete Time, data in OTP will be latched to internal register during this period. This loading is done every time when there is H/W reset complete time (t<sub>REST</sub>) within 5ms after a rising edge of RESX.

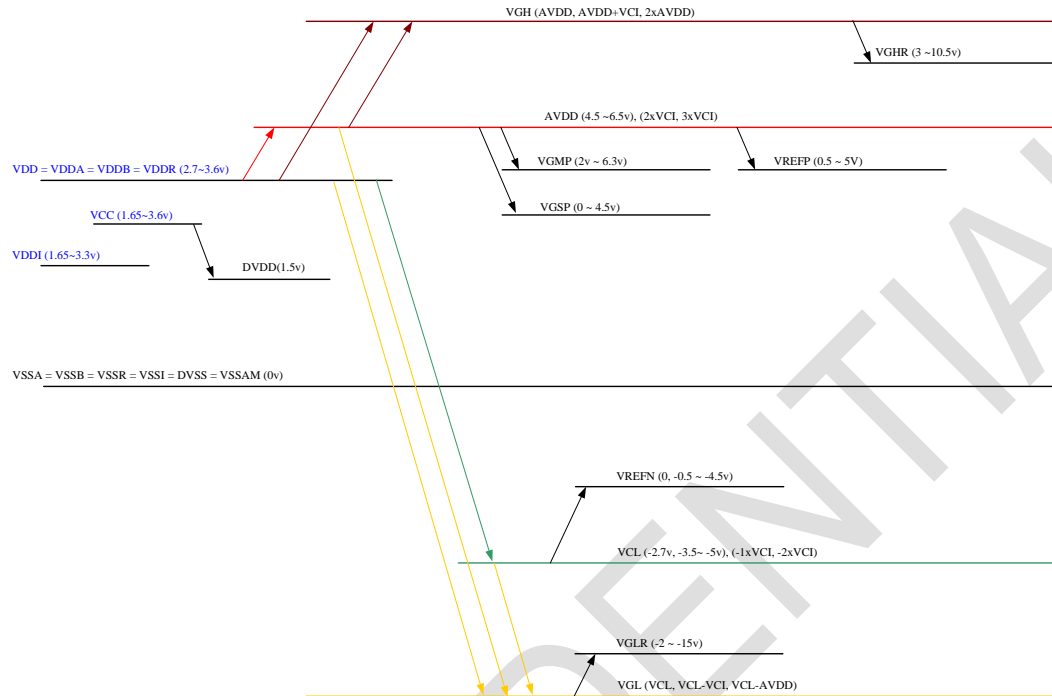

Note 4. Spike Rejection also applies during a valid reset pulse as shown below:

Note 5. It is necessary to wait 10msec after releasing RESX before sending commands. Also Sleep Out command cannot be sent for 120msec.

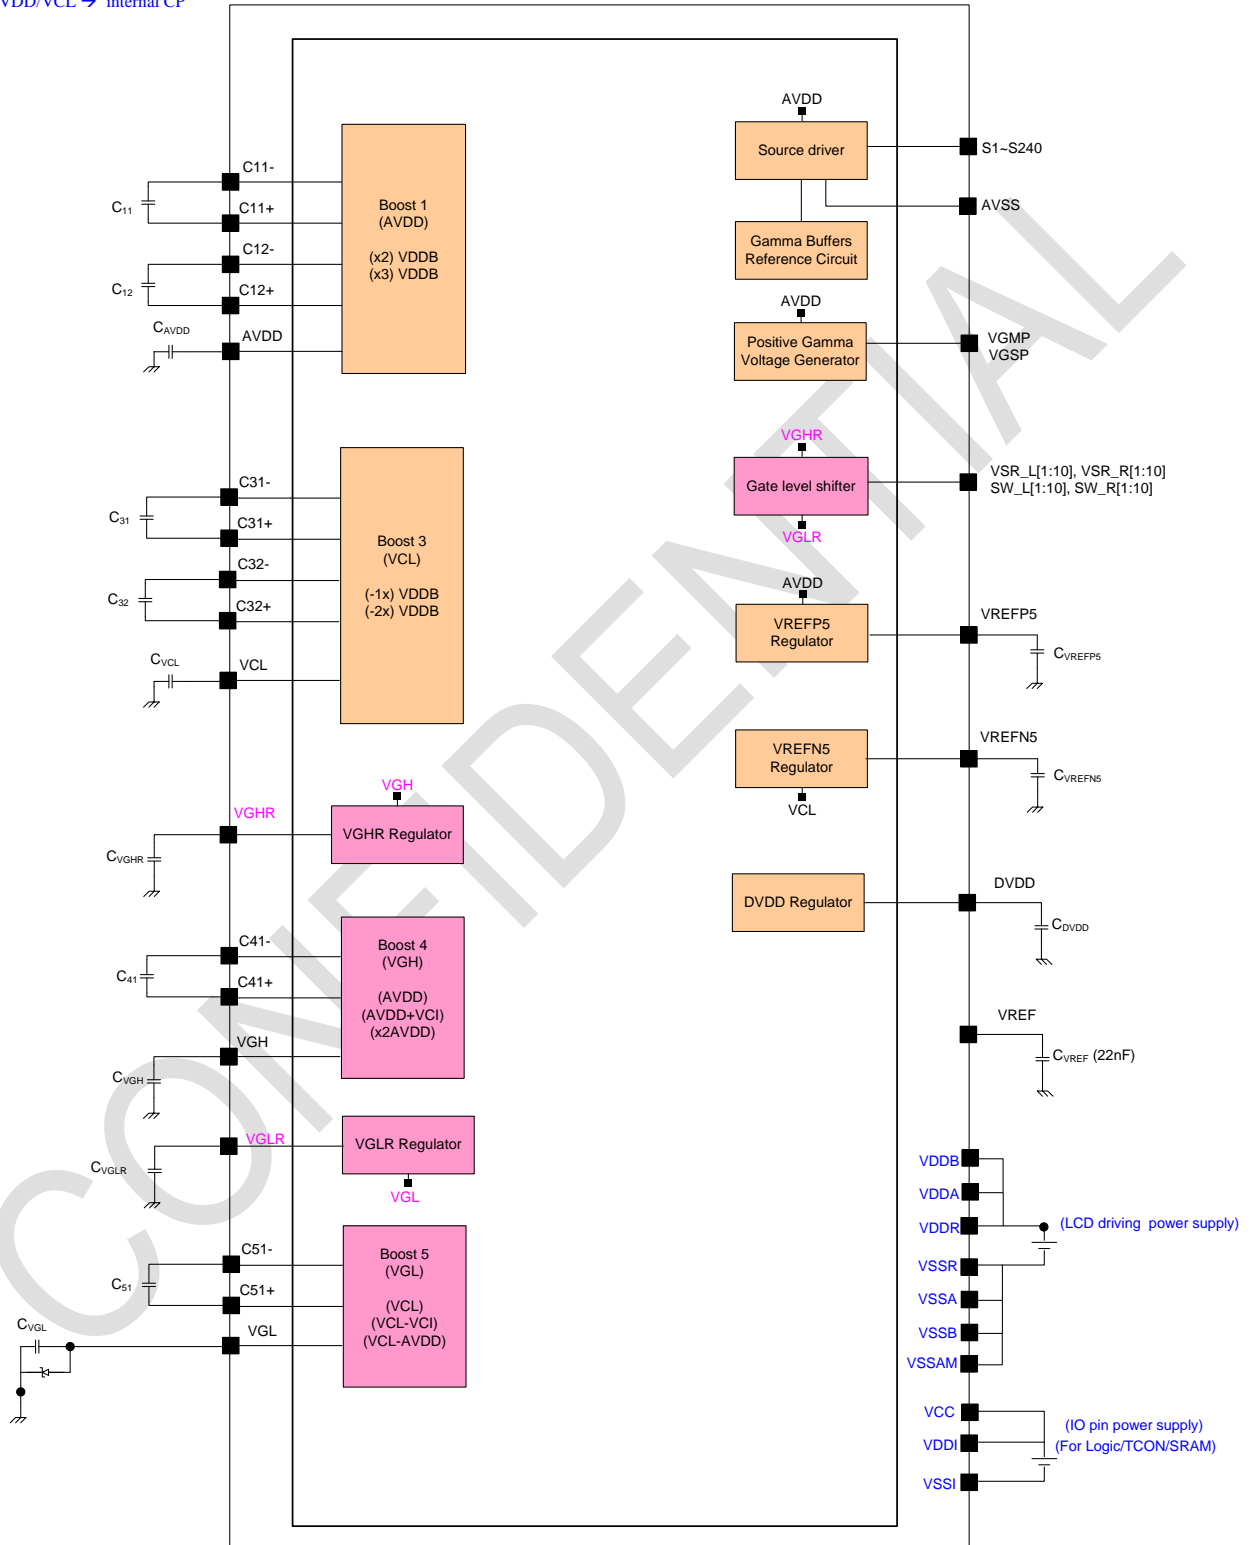

## 8. Power Generation

### 8.1 Two Supply Power ( VDDI / VDD )

## 8.2 DC/DC Converter Circuit

2PWR(VDDI, VDD)  
VDD=VDDA=VDDR=VDDB  
AVDD/VCL → internal CP

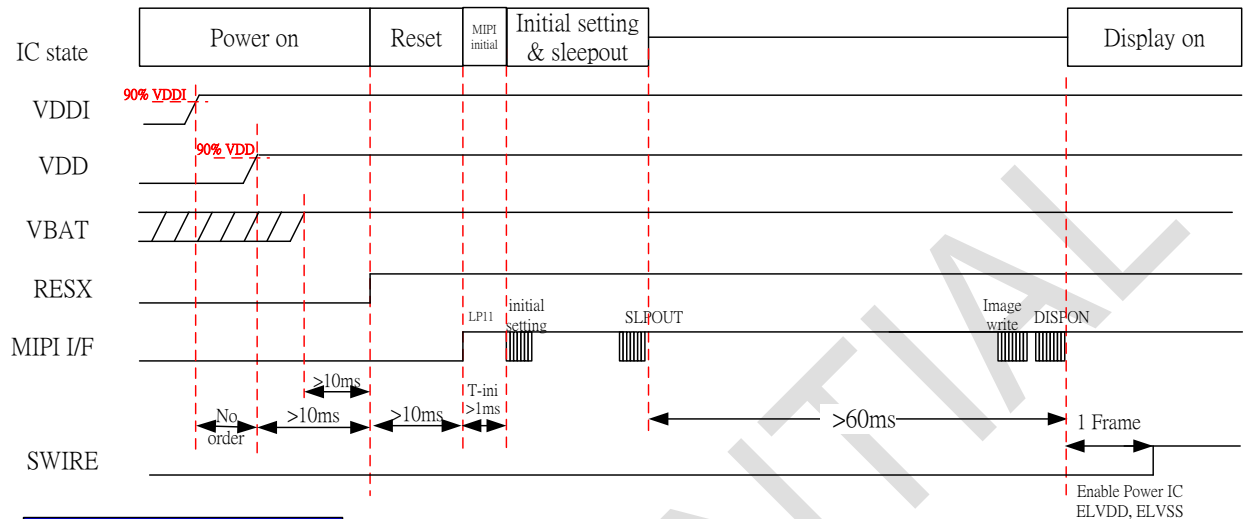

## 8.3 External Components

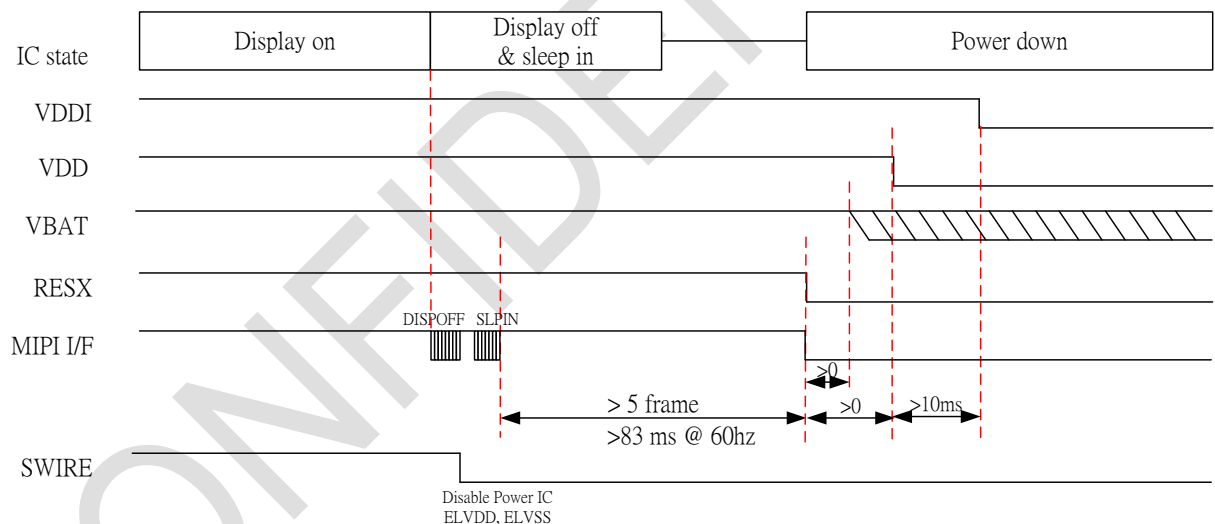

No.	Signal name	Values	Max ability
1	VDDA, VDDR, VDDB	Cap , 2.2uF	6.3V
2	VDDI, VCC	Cap , 2.2uF	6.3V
3	VREF	Cap , 22nF	6.3V
4	DVDD	Cap , 1.0uF	6.3V
5	VREFN/VREFP	Cap , 1.0uF	6.3V
6	VGHR	Cap , 2.2uF	16V
7	VGLR	Cap , 2.2uF	16V
8	OVDD_INT	Cap , 2.2uF	10V
9	OVSS_INT	Cap , 2.2uF	10V
10	C11P/C11N	Cap , 1.0uF	6.3V
11	C12P/C12N	Cap , 1.0uF	6.3V
12	AVDD	Cap , 2.2uF	10V
13	C31P/C31N	Cap , 1.0uF	6.3V
14	C32P/C32N	Cap , 1.0uF	6.3V
15	VCL	Cap , 2.2uF	6.3V
16	C41P/C41N	Cap , 1.0uF	16V
17	VGH	Cap , 2.2uF	25V
18	C51P/C51N	Cap , 1.0uF	16V
19	VGL	Cap , 2.2uF	25V
20	VGL (VGL-GND)	Schottky Diode	

## 8.4 Power on/off sequence and timing

### Power On sequence

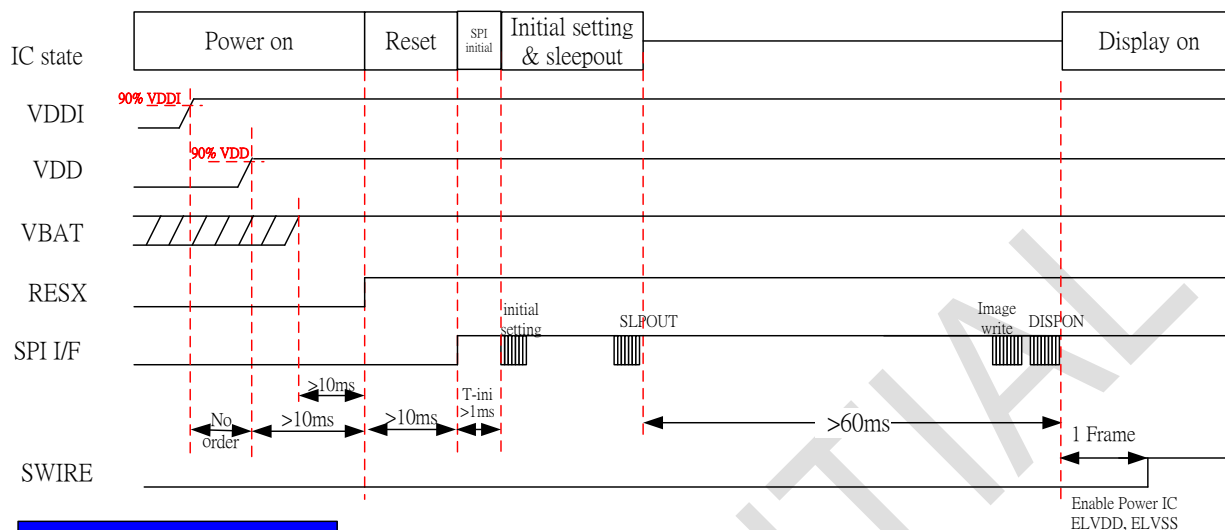

### Power Off sequence

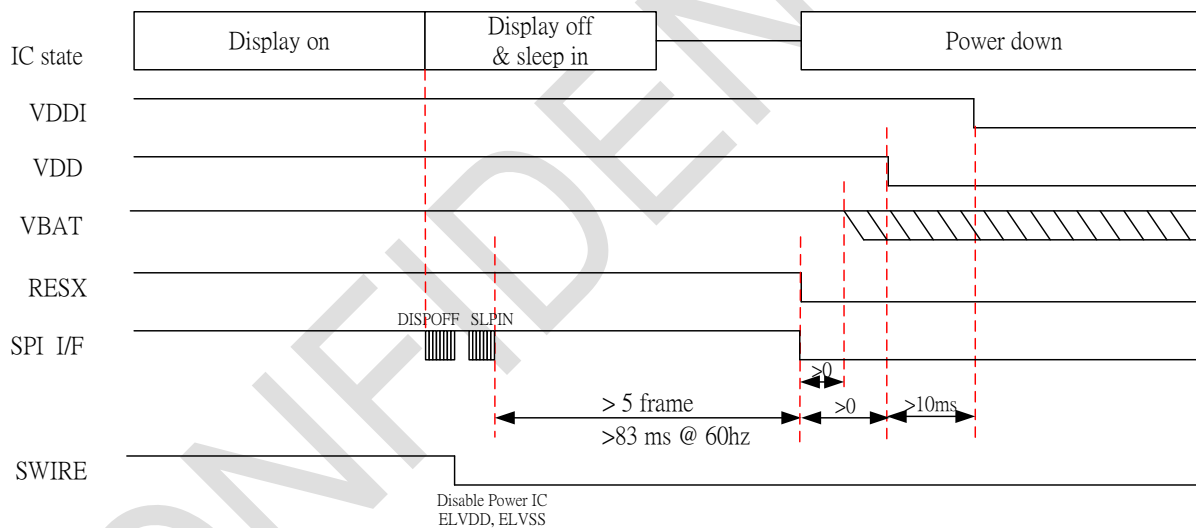

## Power On sequence

## SPI Interface

## Power Off sequence

## SPI Interface

## 8.5 Power Level Modes

Normal display mode on = NORON

Partial mode on = PTLON

Idle mode off = IDMOFF

Idle mode on = IDMON

Sleep out = SLPOUT

Sleep in = SLPIN

Deep standby mode = DSTBON

### Definition example:

**1. Normal Mode On (full display), Idle Mode Off, Sleep Out.**

In this mode, the display is able to show maximum 16.7M colors.

**2. Partial Mode On, Idle Mode Off, Sleep Out**

In this mode, part of the display is used with maximum 16.7M colors.

**3. Normal Mode On (full display), Idle Mode On, Sleep Out.**

In this mode, the full display is used but with 8 colors.

**4. Partial Mode On, Idle Mode On, Sleep Out**

In this mode, part of the display is used but with 8 colors.

**5. Sleep In Mode.**

In this mode, the DC/DC converter, internal oscillator and panel driver circuit are stopped. Only the MPU interface and registers are working with VDDI power supply. Contents of the frame memory can be safe or random.

**6. Deep Standby Mode.**

In this mode, the DC/DC converter, internal oscillator and panel driver circuit are stopped. The MPU interface and registers are not working. Contents of the frame memory are random.

**7. Power Off Mode**

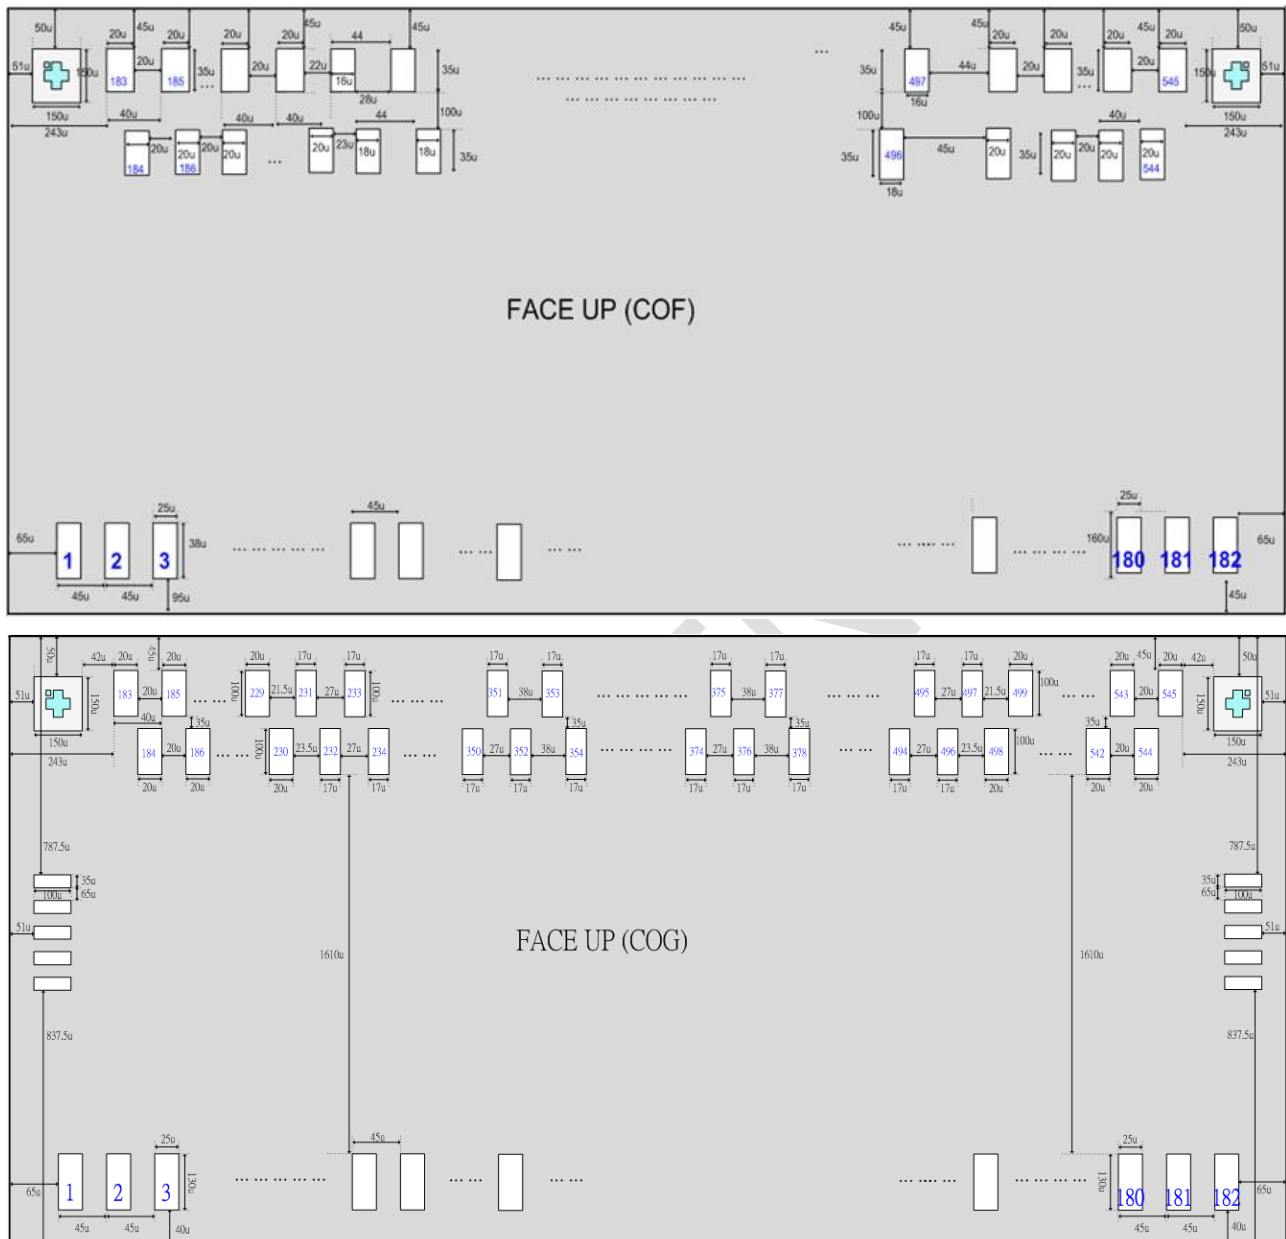

In this mode, VDDI and VDDA/VDDR/Vddb are removed.

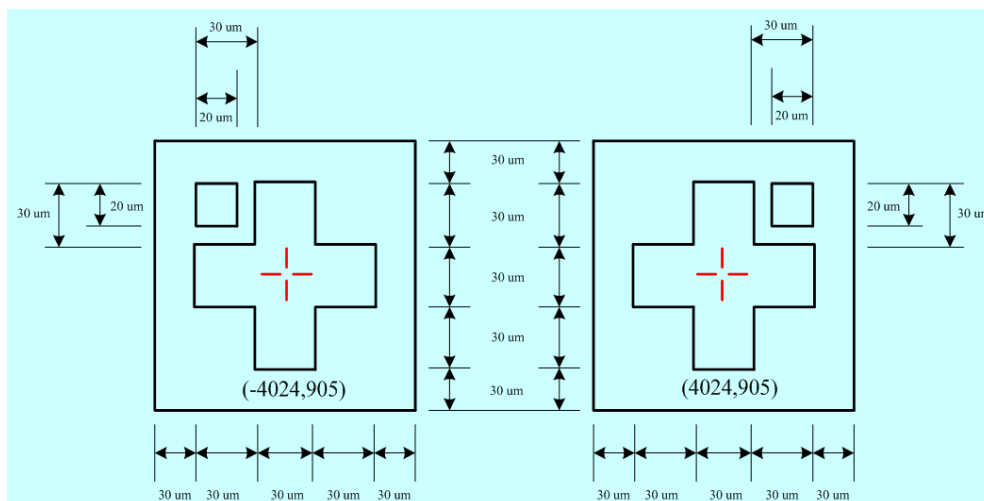

NOTE: Transition between mode 1~5 is controllable by MPU commands. Mode 6 is entered for power saving with both power supplies for I/O and analog circuits and can be exited by hardware reset only (RESX=L). Mode 7 is entered only when both power supplies for I/O and analog circuits are removed.

## 8.6 Maximum Series Resistance

Pin Name	Type	Max Resistance	Unit
VDDA, VDDDB, VDDR, VDDI, VCC,	Power Supply	5	Ω
AVSS, VSSAM, DVSS, VSSI, VSSA, VSSR, VSSB	Power Supply	5	Ω
AVDD	Power Input/Output	5	Ω
DVDD	Power Output	5	Ω
VCL	Power Output	5	Ω
VGH, VGL	Power Output	10	Ω
C11P/N~C12P/N	Capacitor Connection	5	Ω
C31P/N~C32P/N	Capacitor Connection	5	Ω
C41P/N	Capacitor Connection	5	Ω
C51P/N	Capacitor Connection	5	Ω
HSSI_CLK_P/N, HSSI_DATA0_P/N, HSSI_DATA1_P/N,	MIPI Interface I/O	5	Ω
TE, SWIRE, OLED_EN	Digital Output I/O	20	Ω
RESX, CSX, D/CX, SCL, SDI, SDO,D[0]~D[7]	Digital Interface I/O	20	Ω
IM[1 :0], DSWAP, PSWAP	Input I/O	100	Ω
MTP_PWR	Power Supply	5	Ω
S[1]~S[240]	Source output	20	Ω
VSR_L[1]~ VSR_L[10], VSR_R[1]~ VSR_R[10] SW_L[1]~ SW_L[10], SW_R[1]~ SW_R[10]	GOA,SWoutput	20	Ω

## 9. Pad Diagram and Coordination

- ◆ Chip size: 8300 um x 2060um (Include sealing and scribe line)
- ◆ Chip thickness: 200/300 um
- ◆ PAD coordinates: PAD center
- ◆ PAD coordinates origin: Chip center
- ◆ Au bump size
  - ❖ COF:
    - ◆ 16um/18um x 35um: Source:S1~S240
    - ◆ 20um x 35um: gate control signal
    - ◆ 25um x 38um: Input Pads
  - ❖ COG:
    - ◆ 17um x 100um: Source:S1~S240
    - ◆ 20um x 100um: gate control signal
    - ◆ 25um x 130um: Input Pads
- ◆ Au bump pitch: See PAD coordinates table
- ◆ Au bump height: 12±2 um (typ.)
- ◆ No. in the figure corresponds to No. in the PAD coordinates table
- ◆ Alignment mark

Alignment mark shape	X	Y
